

# How do we identify and recommend forcings datasets for models example of simple plume aerosols

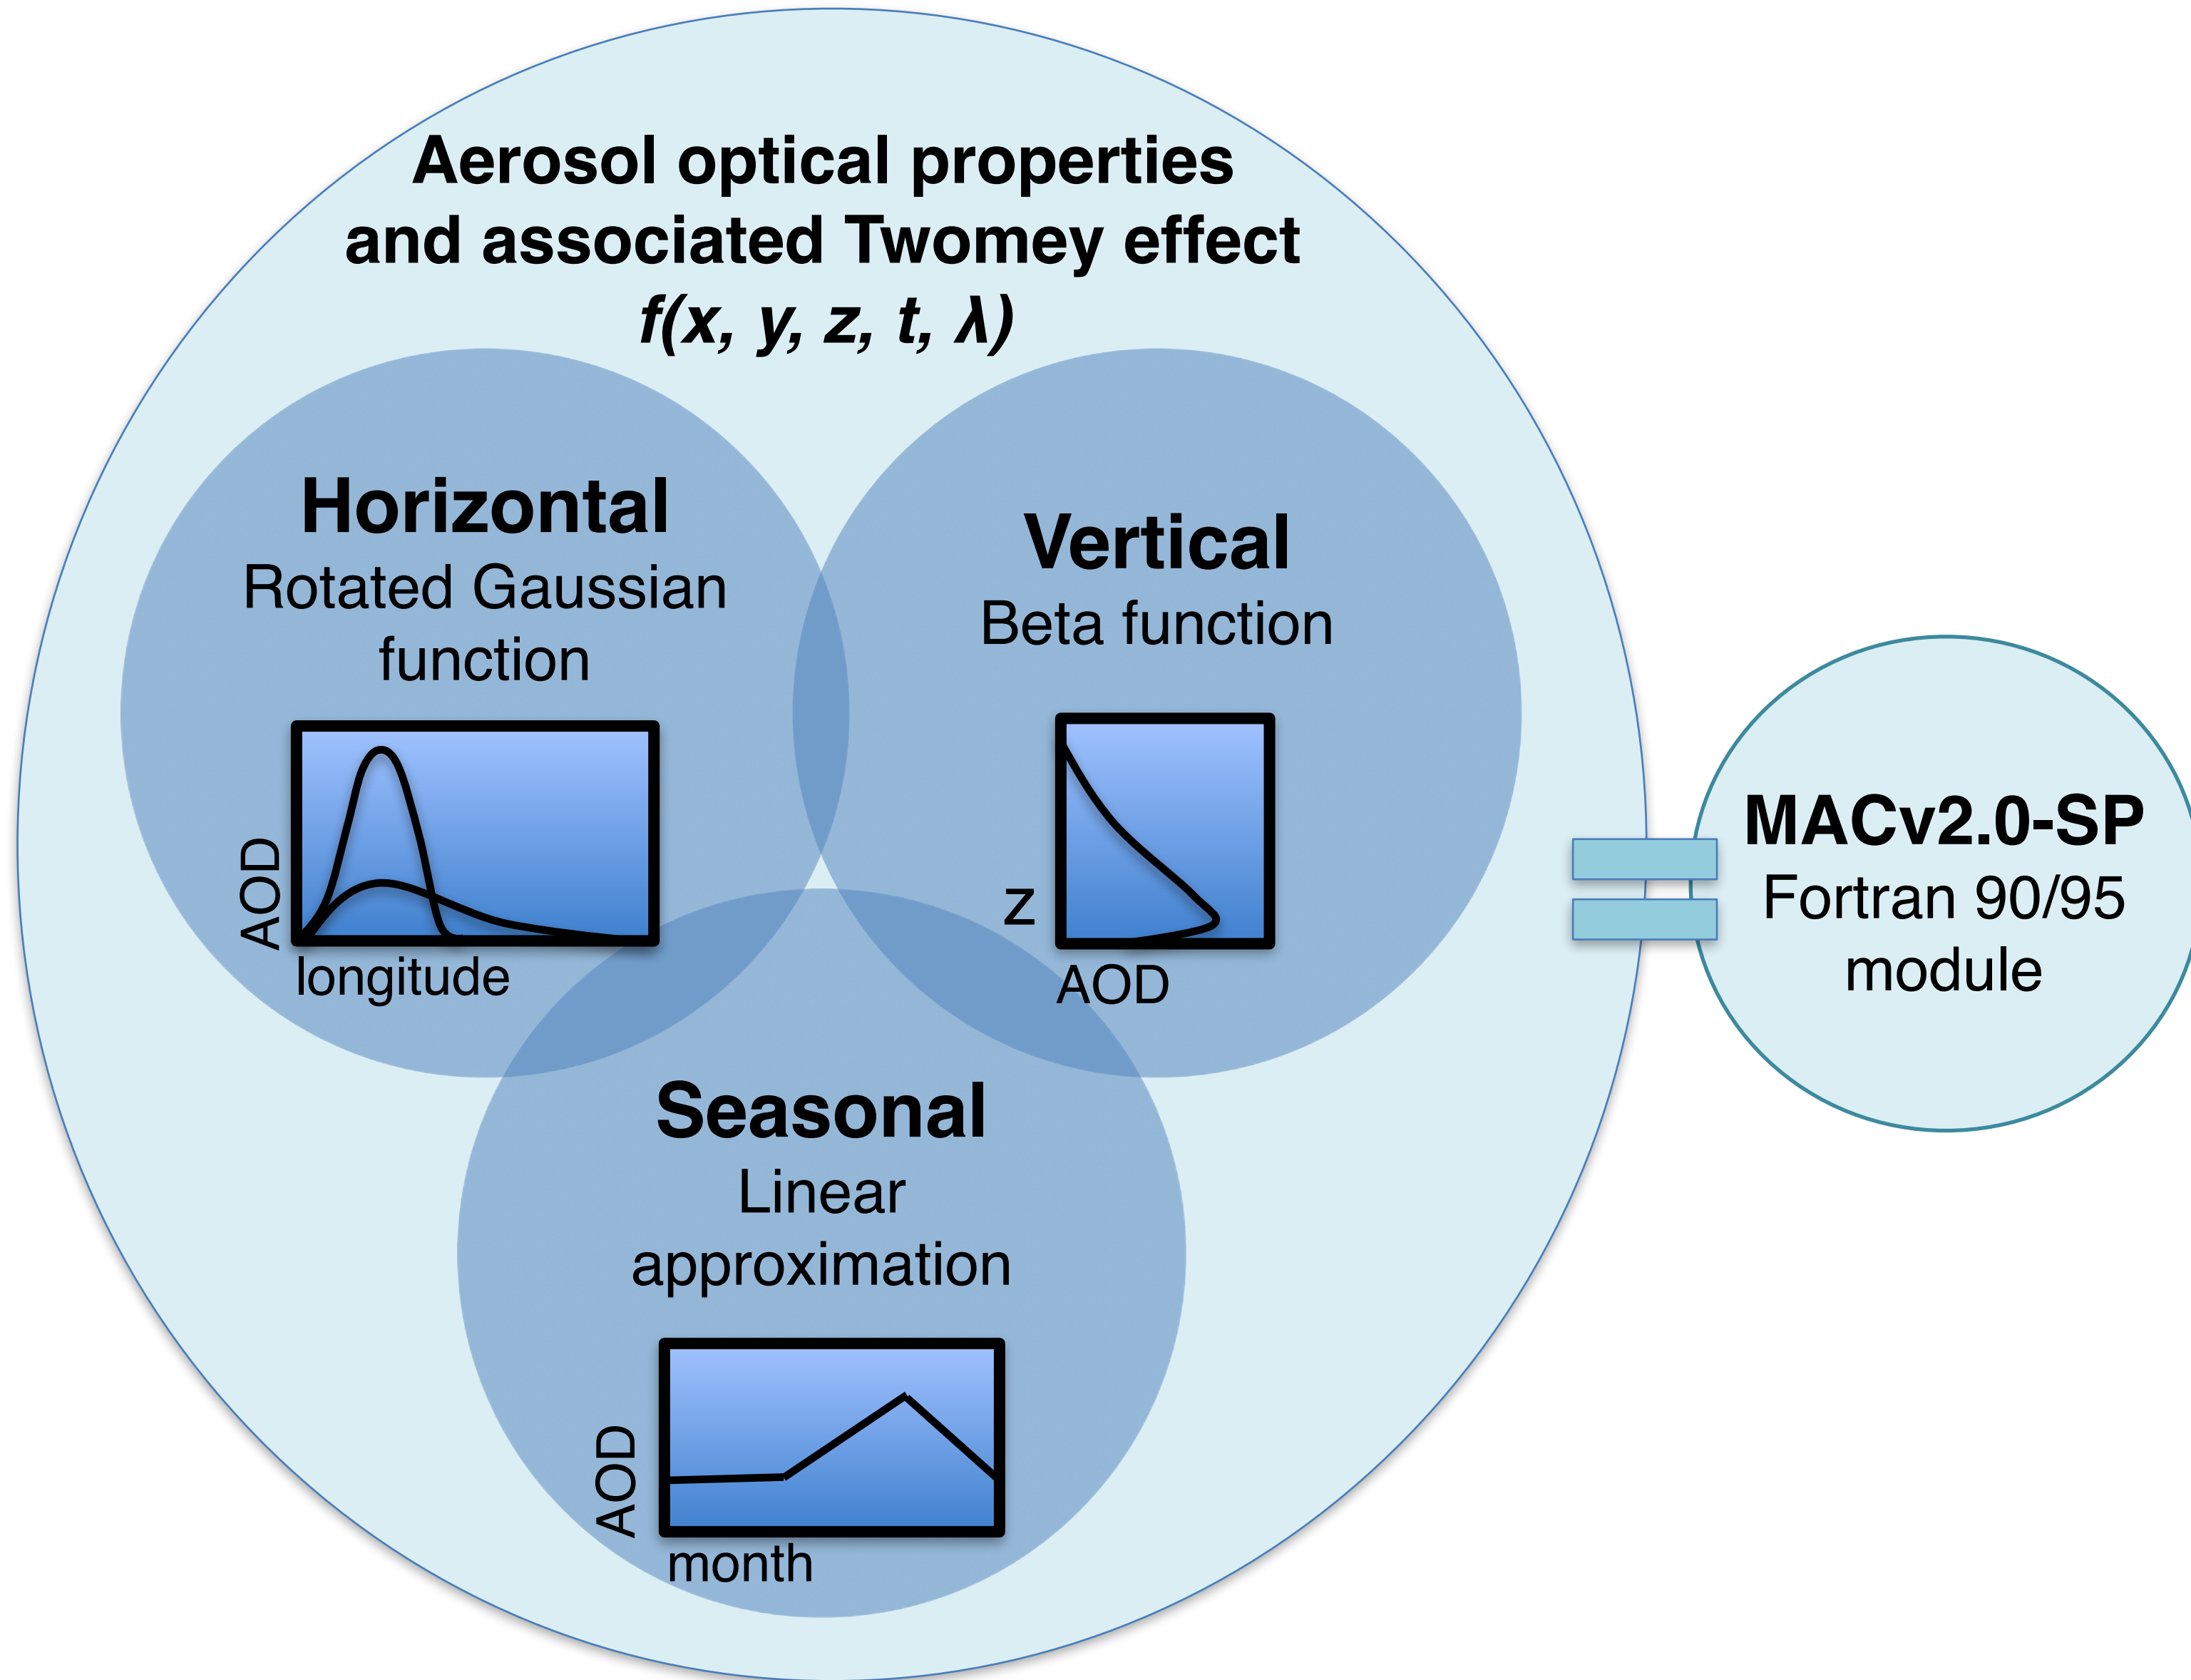

Stephanie Fiedler

CMIP Forcings Workshop, ECMWF Reading  
29 October 2024

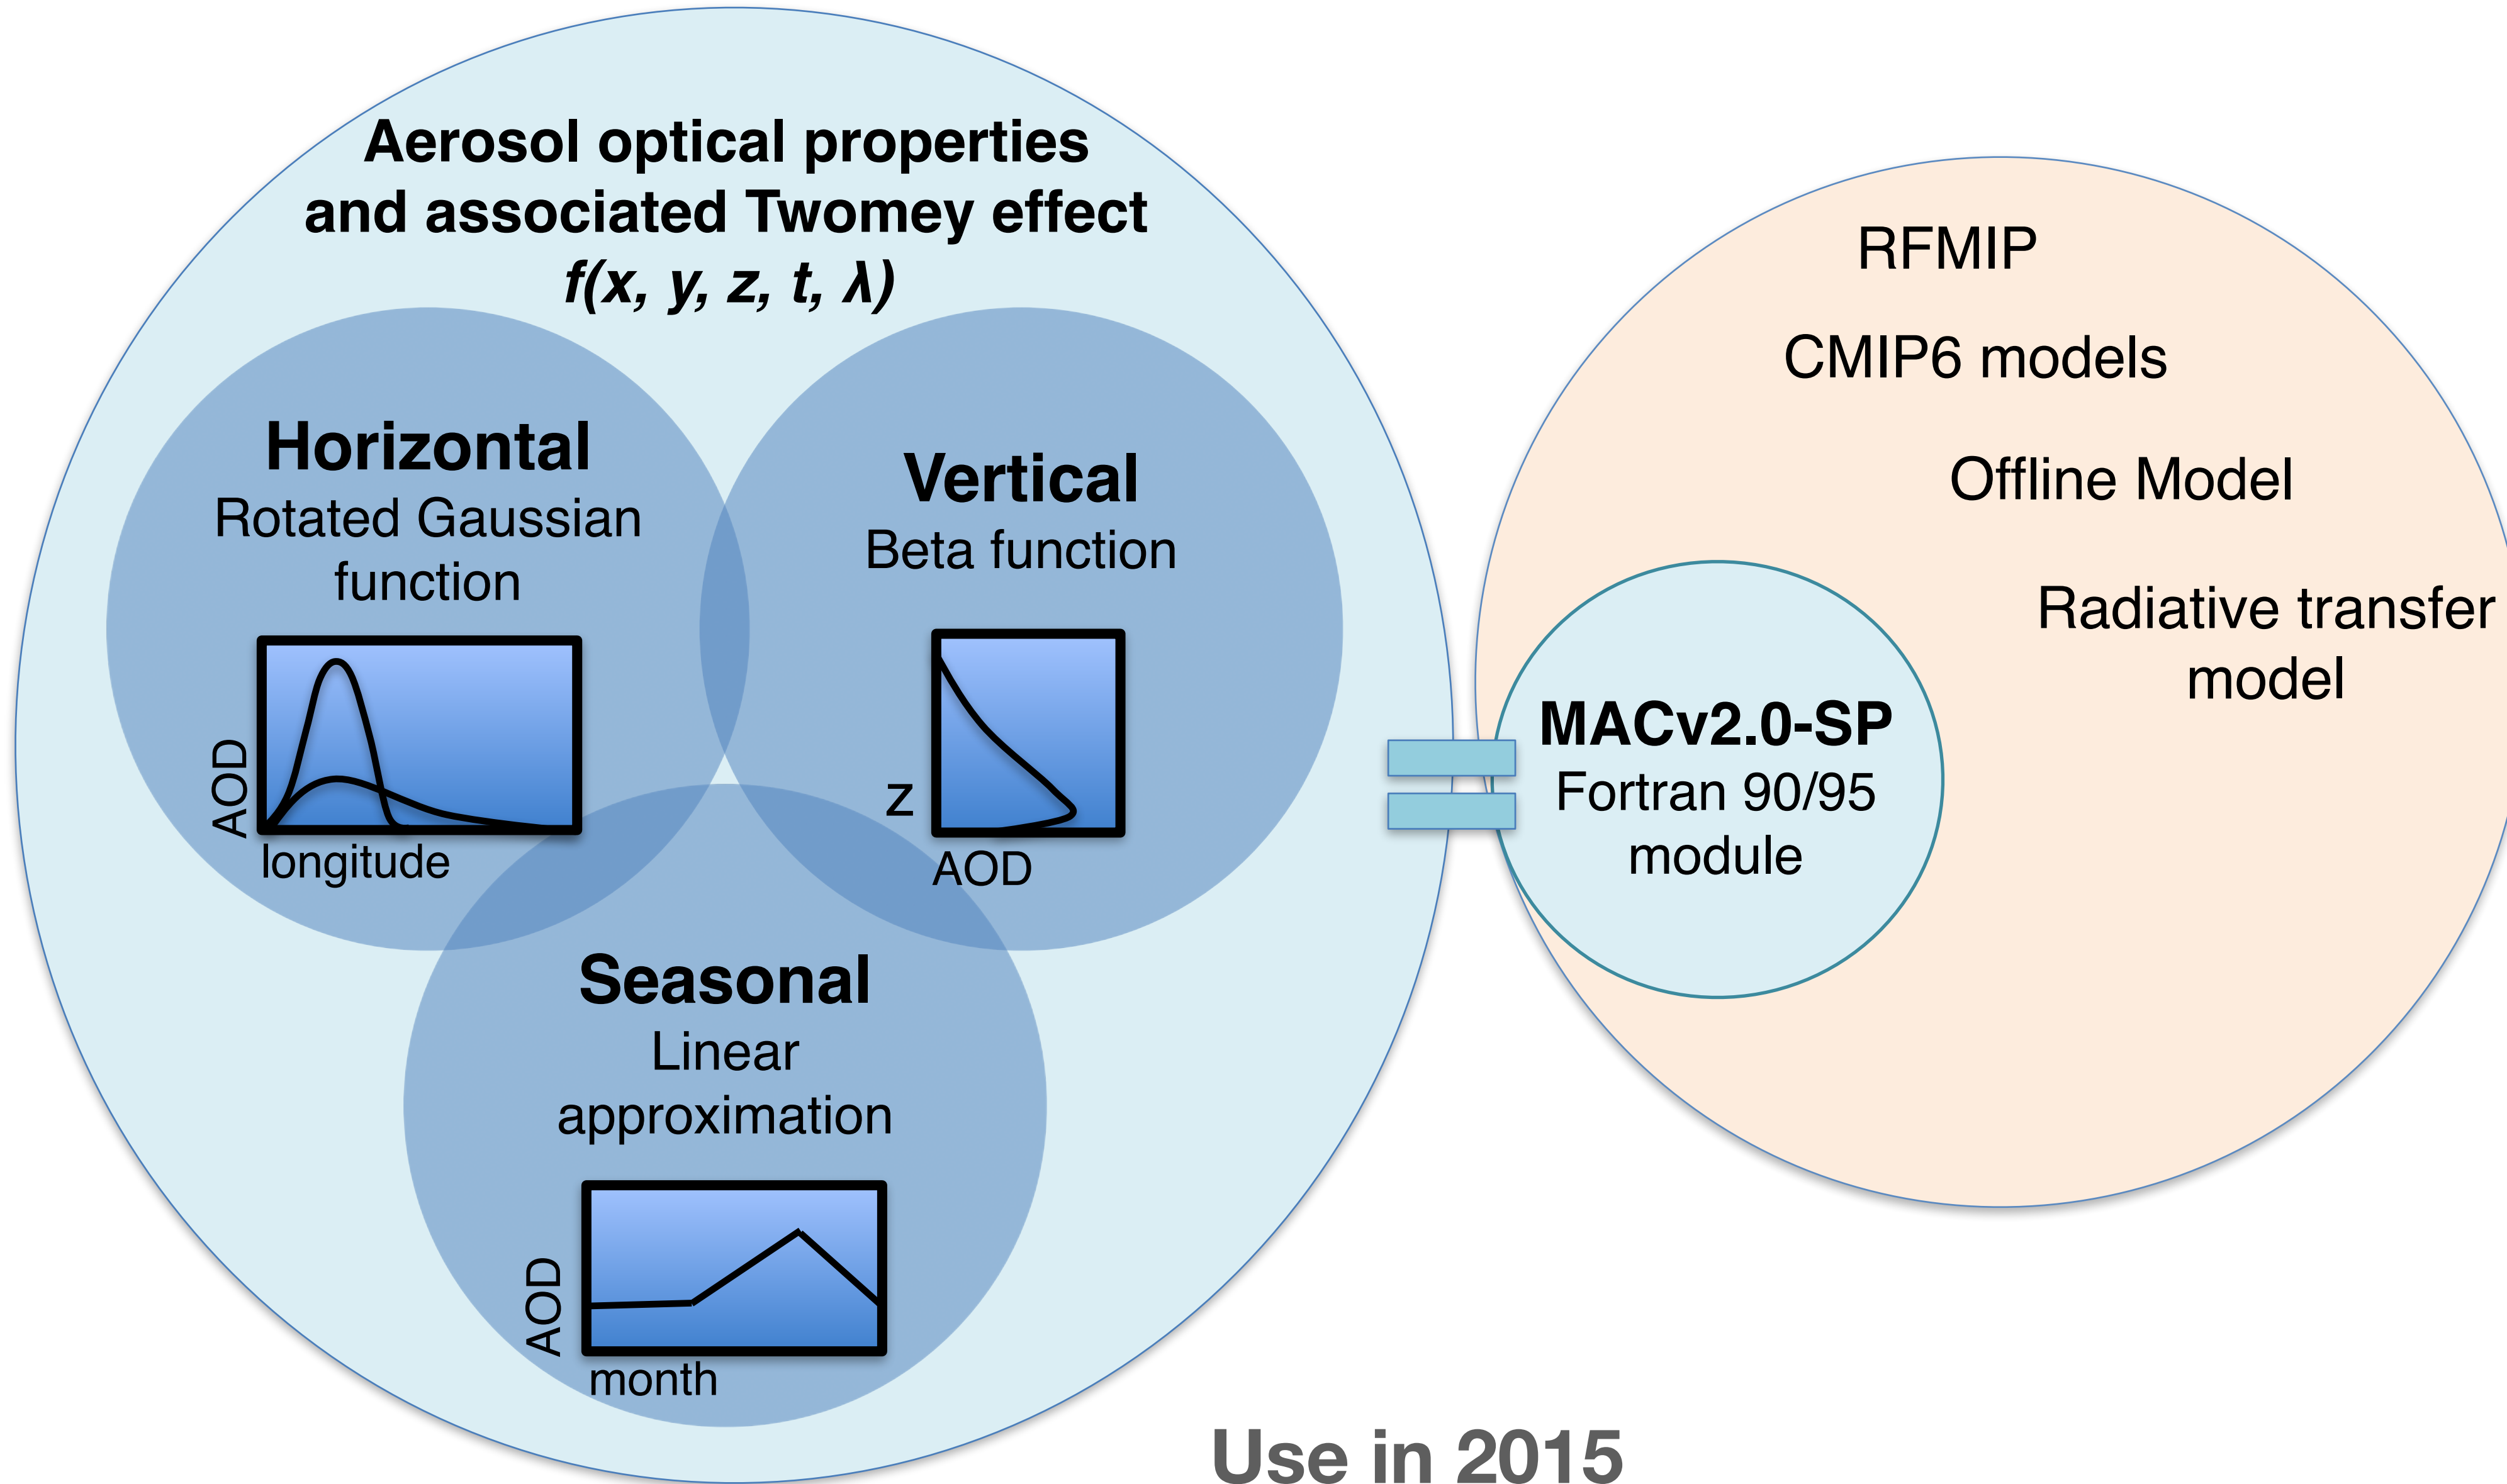

# Simple plumes parameterisation

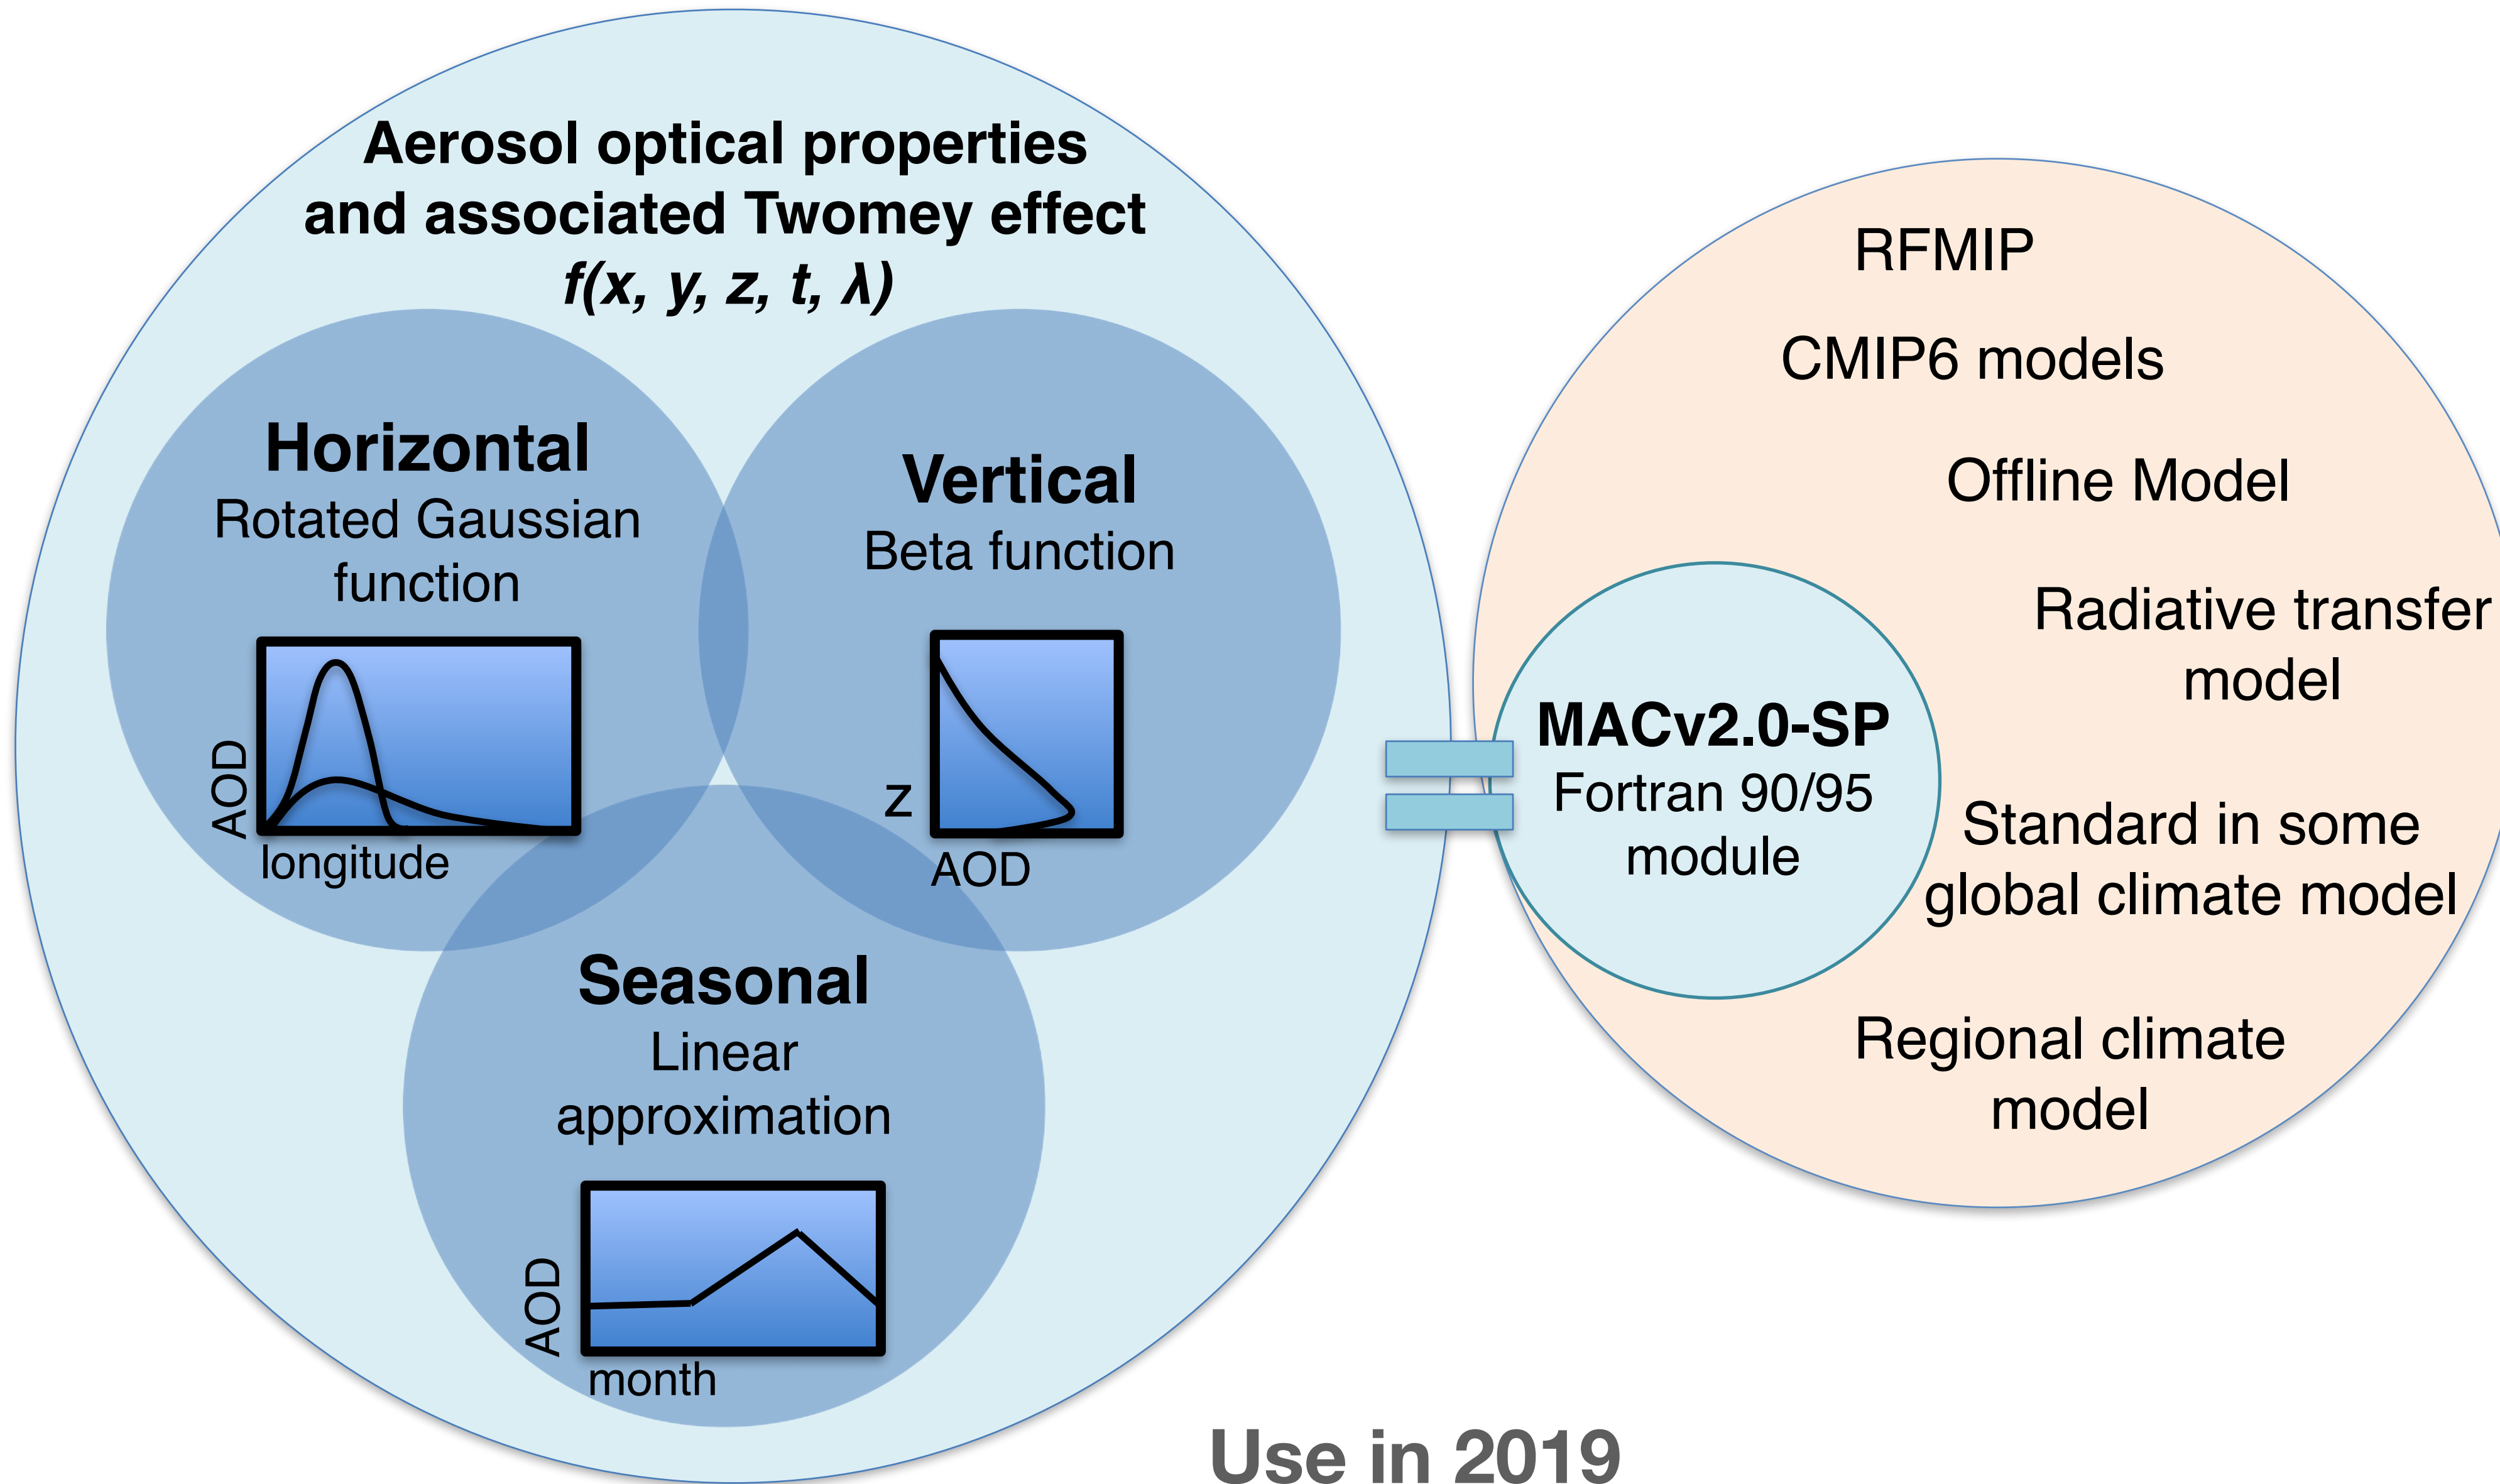

# Simple plumes parameterisation

# Simple plumes parameterisation

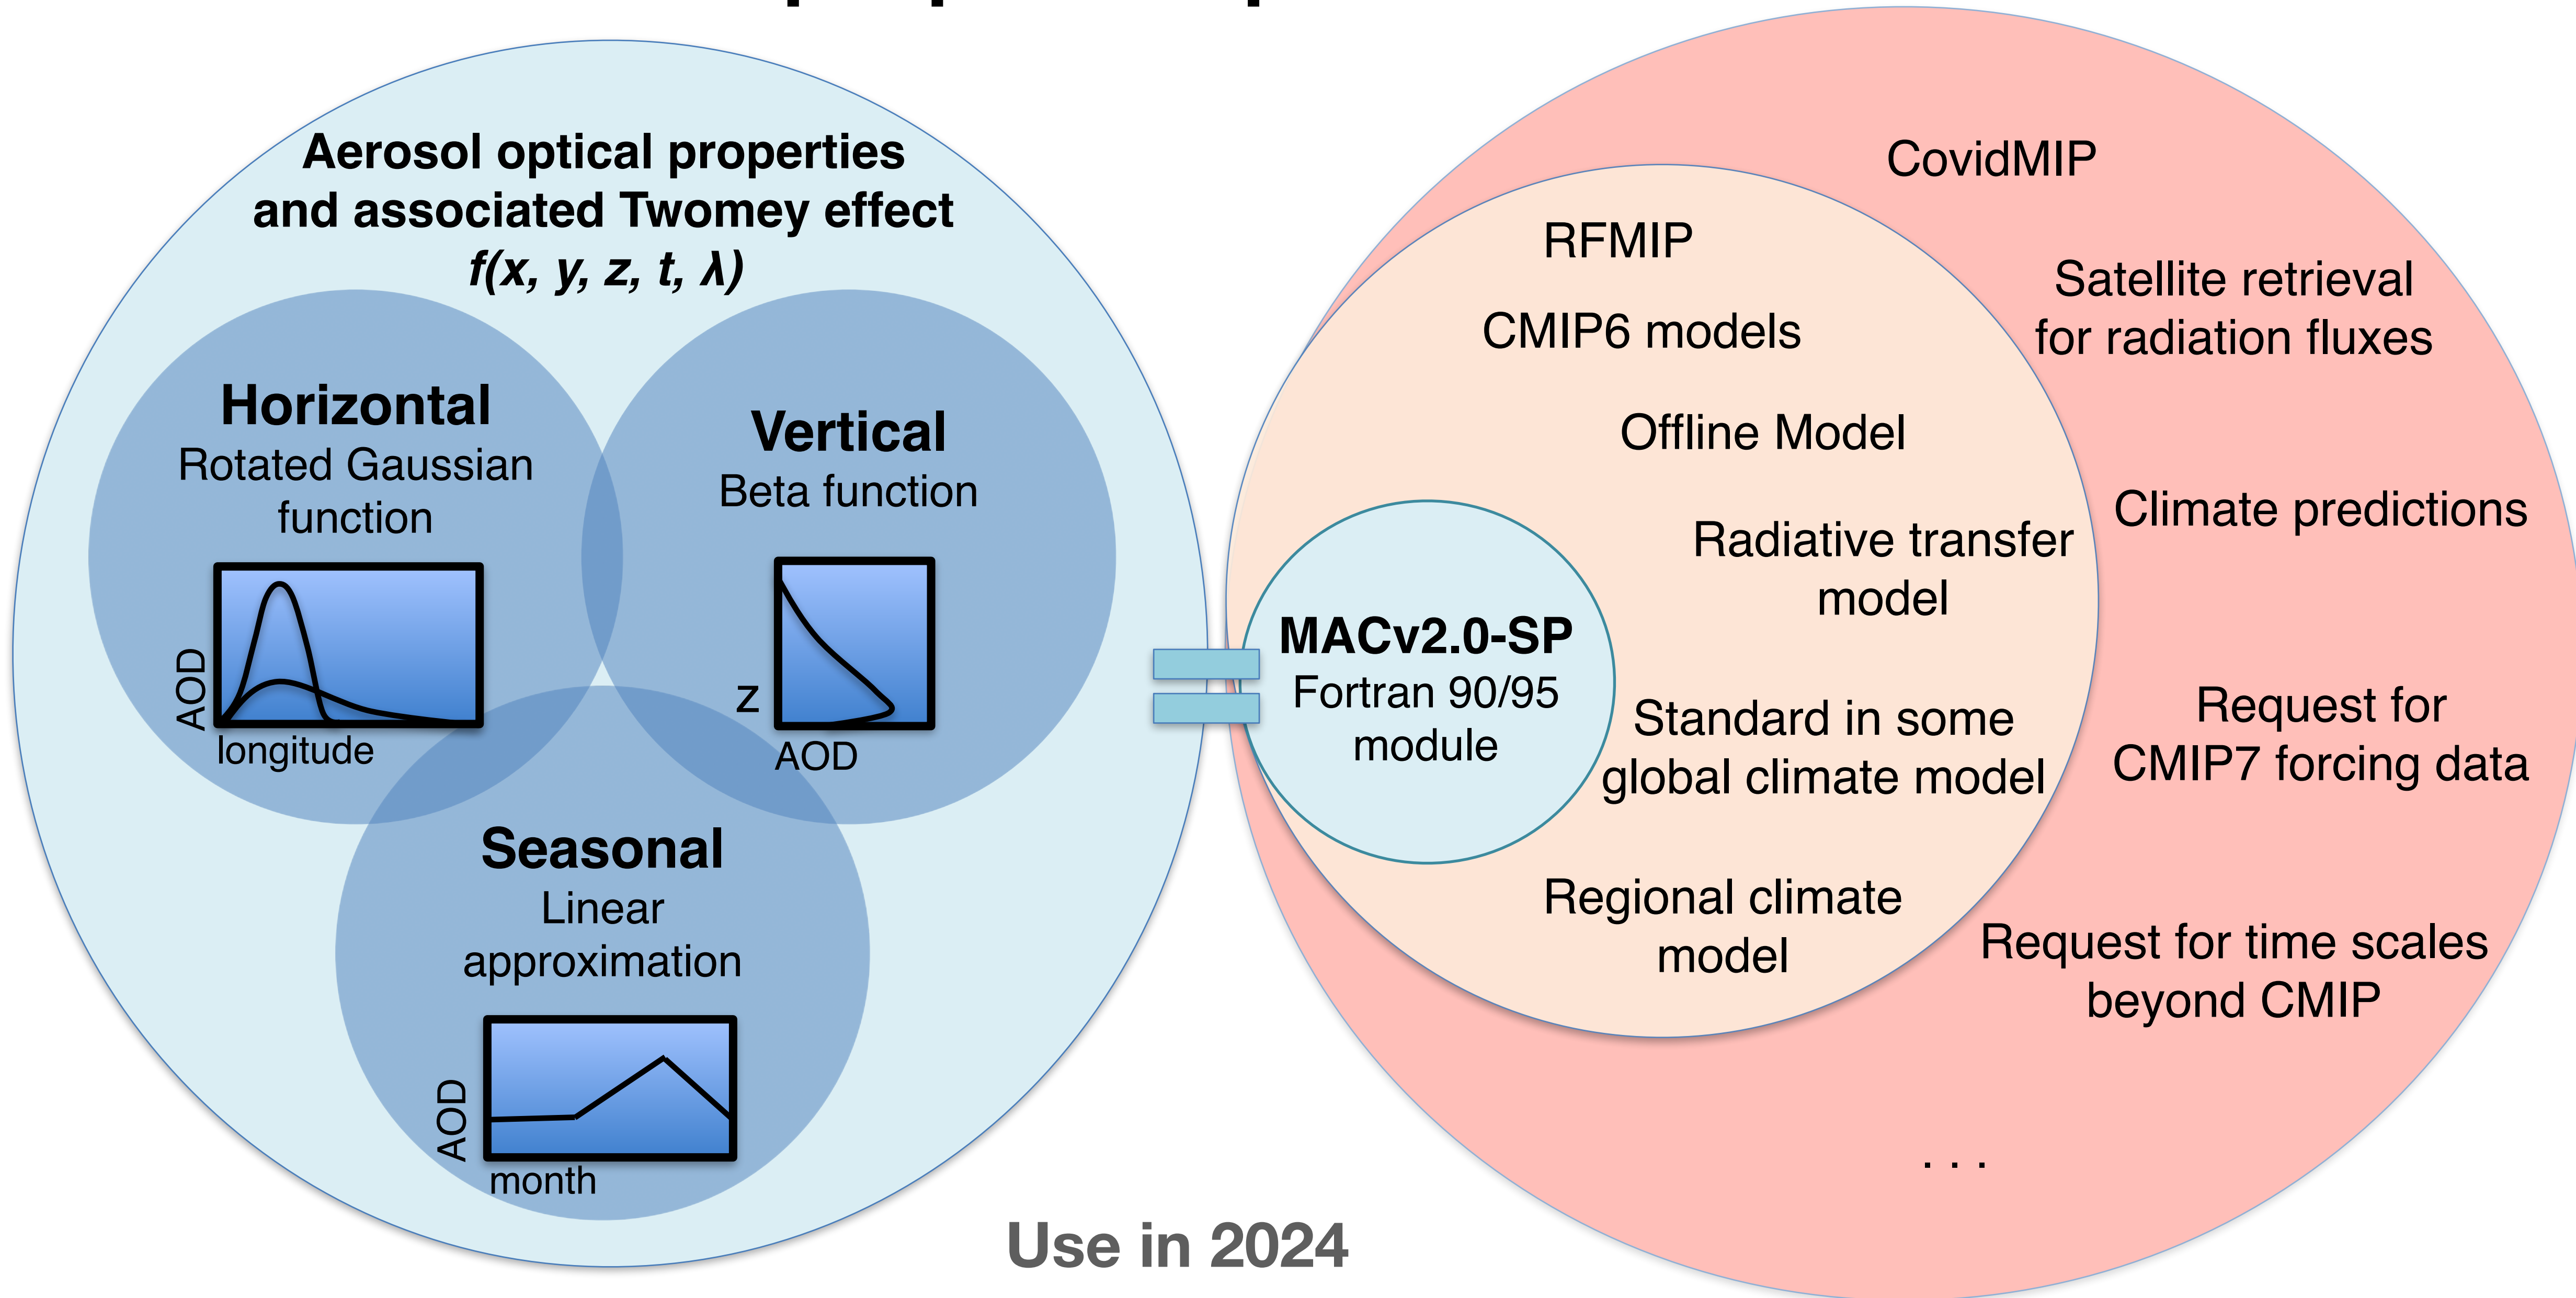

**Use in 2019**

CMIP6 historical data from Stevens et al. (2017)

CMIP6 Scenario data from Fiedler et al. (2019)

# Simple plumes parameterisation

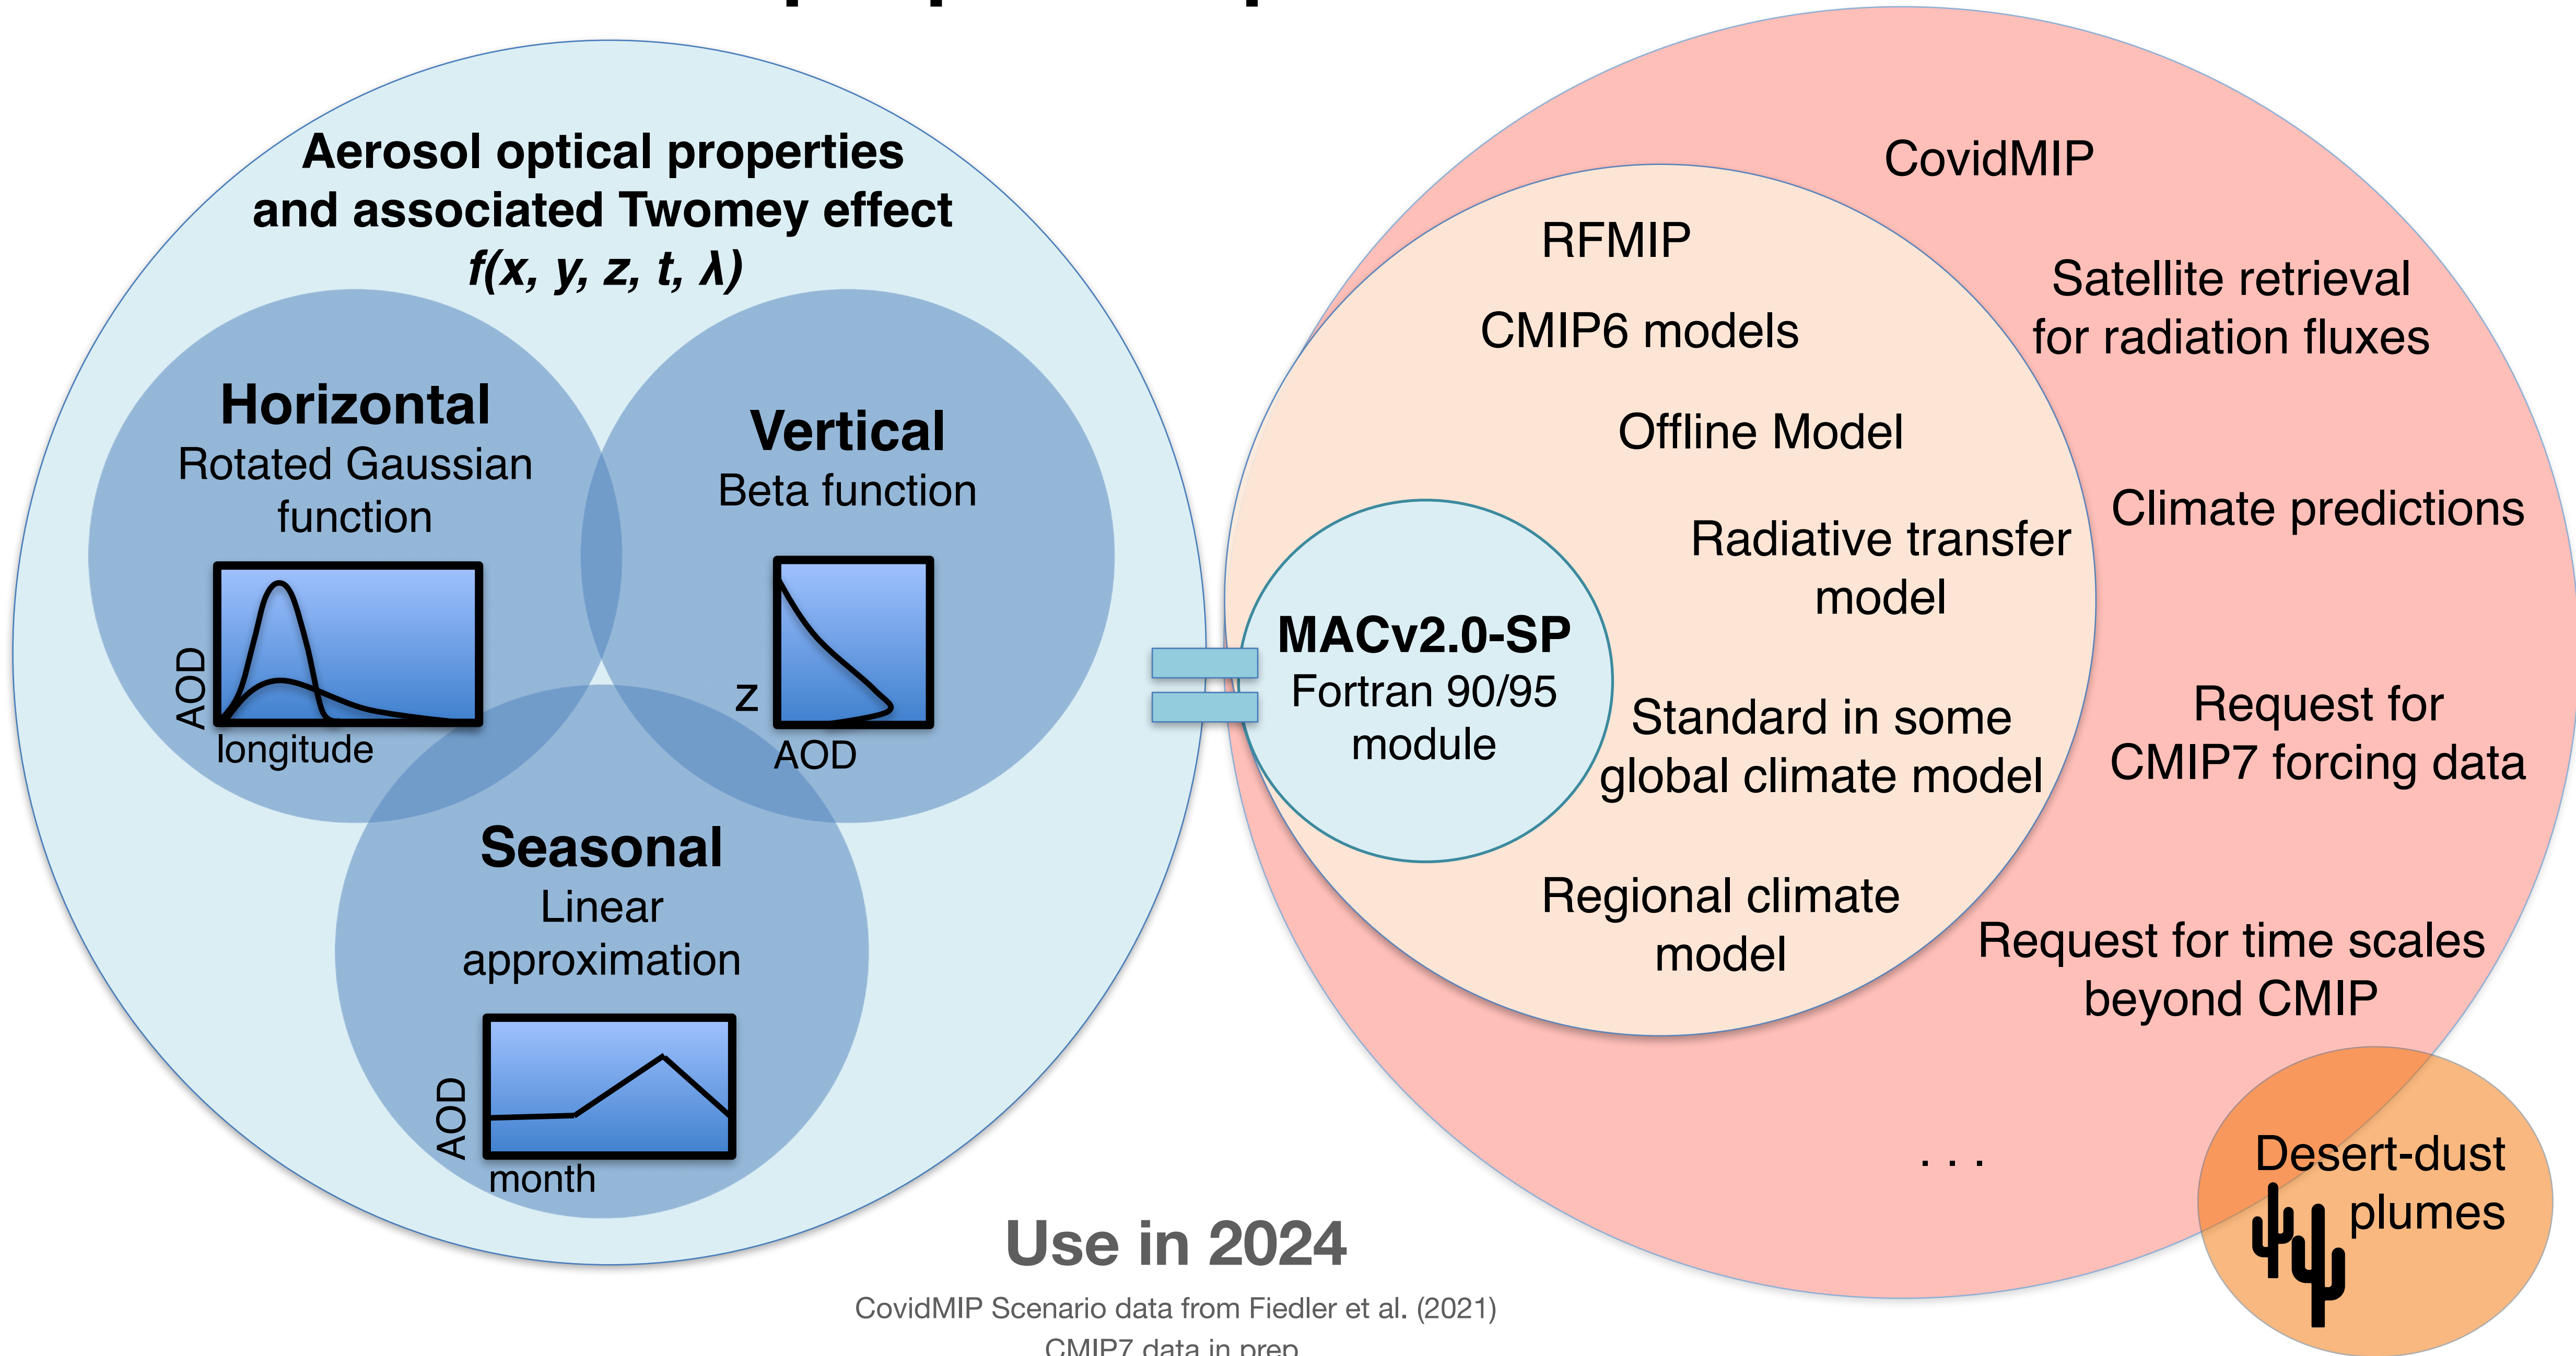

CovidMIP Scenario data from Fiedler et al. (2021)

CMIP7 data in prep.

# Simple plumes parameterisation

# Simple plumes parameterisation

## Why MACv2.0-SP ?

**Constrained by observations**

Optical properties from MACv2.0 climatology

**Computationally efficient**

Mathematical construction of plumes at nine locations

**Easy to implement**

Input: grid, orography, time, wavelength  
F90/95 and netCDF

**Flexible applications**

Different models, resolutions, and time periods

Easily changeable setup to facilitate experimentation

# Simple plumes parameterisation

## Why MACv2.0-SP ?

**Constrained by observations**

Optical properties from MACv2.0 climatology

**Computationally efficient**

Mathematical construction of plumes at nine locations

**Easy to implement**

Input: grid, orography, time, wavelength F90/95 and netCDF

**Flexible applications**

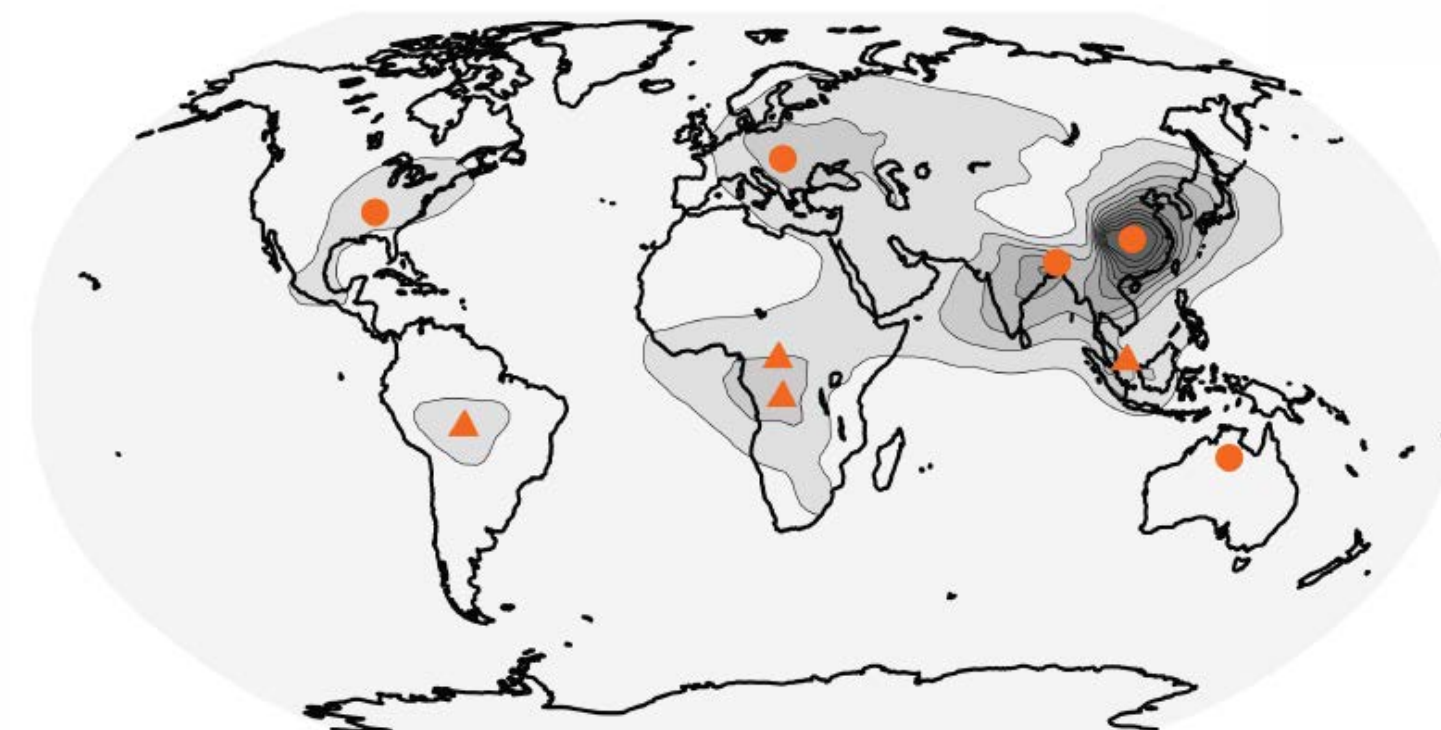

Different models, resolutions, and time periods

Easily changeable setup to facilitate experimentation

## Informed by observational climatology

### Spatial pattern for 2005

anthropogenic fine-mode AOD

Stevens et al. (2017)

# Simple plumes parameterisation

## Why MACv2.0-SP ?

**Constrained by observations**

Optical properties from MACv2.0 climatology

**Computationally efficient**

## Informed by observational climatology

### Spatial pattern for 2005

Stevens et al. (2017)

## Scaling with emissions of SO<sub>2</sub> and NH<sub>3</sub>

### MACv2-SP for CMIP6 scenarios

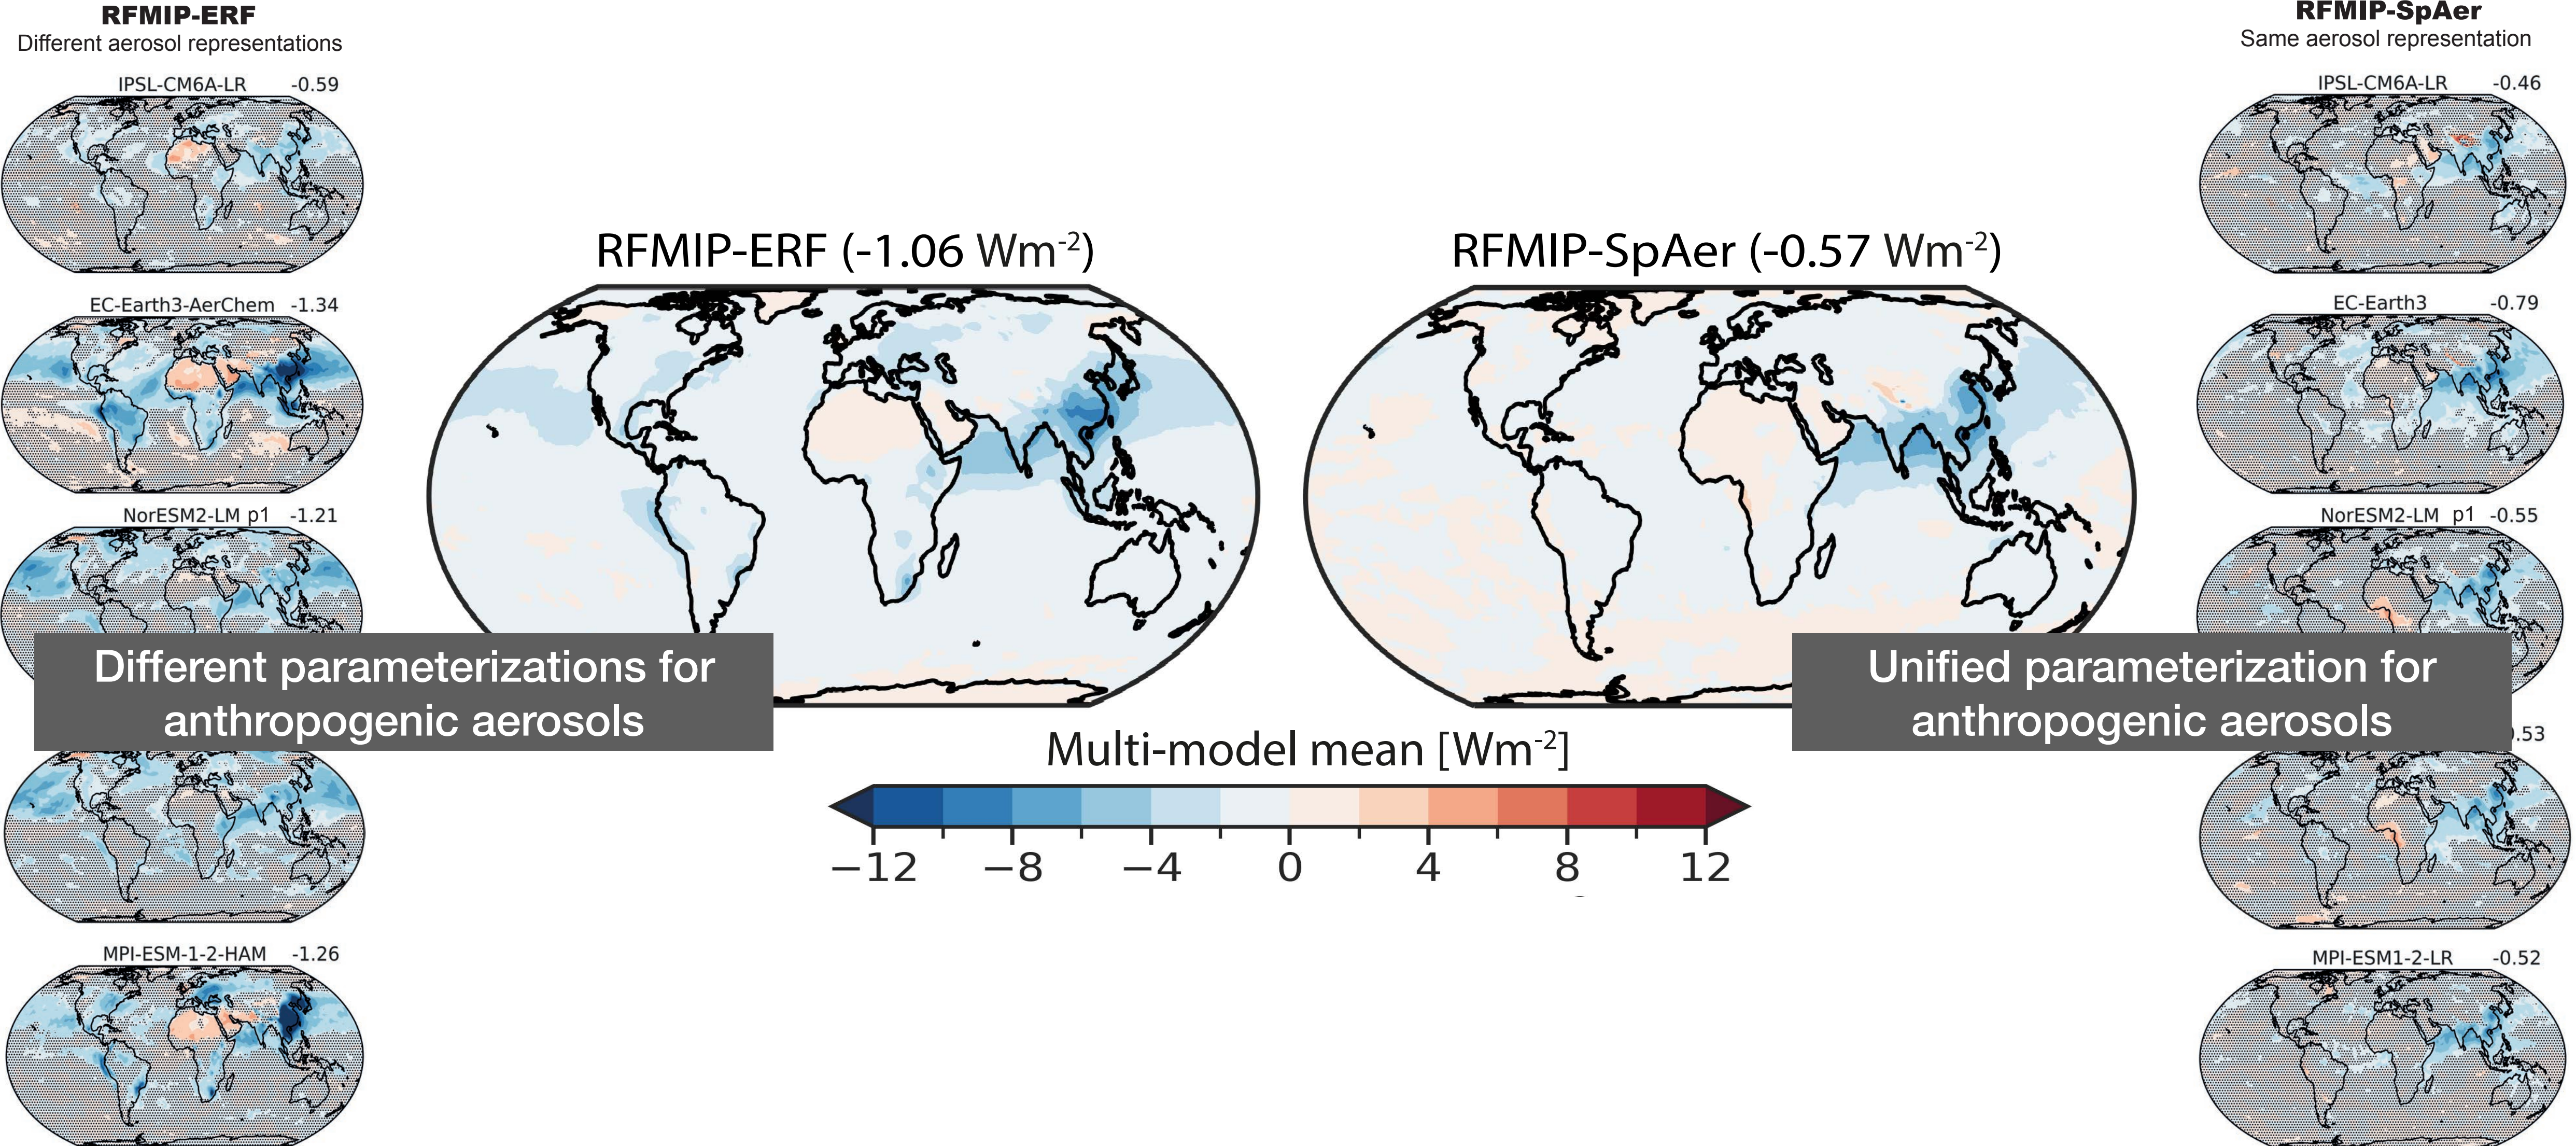

Fiedler et al. (2019)

**How was MACv2-SP used to better understand the reasons for the model differences in aerosol ERF?**

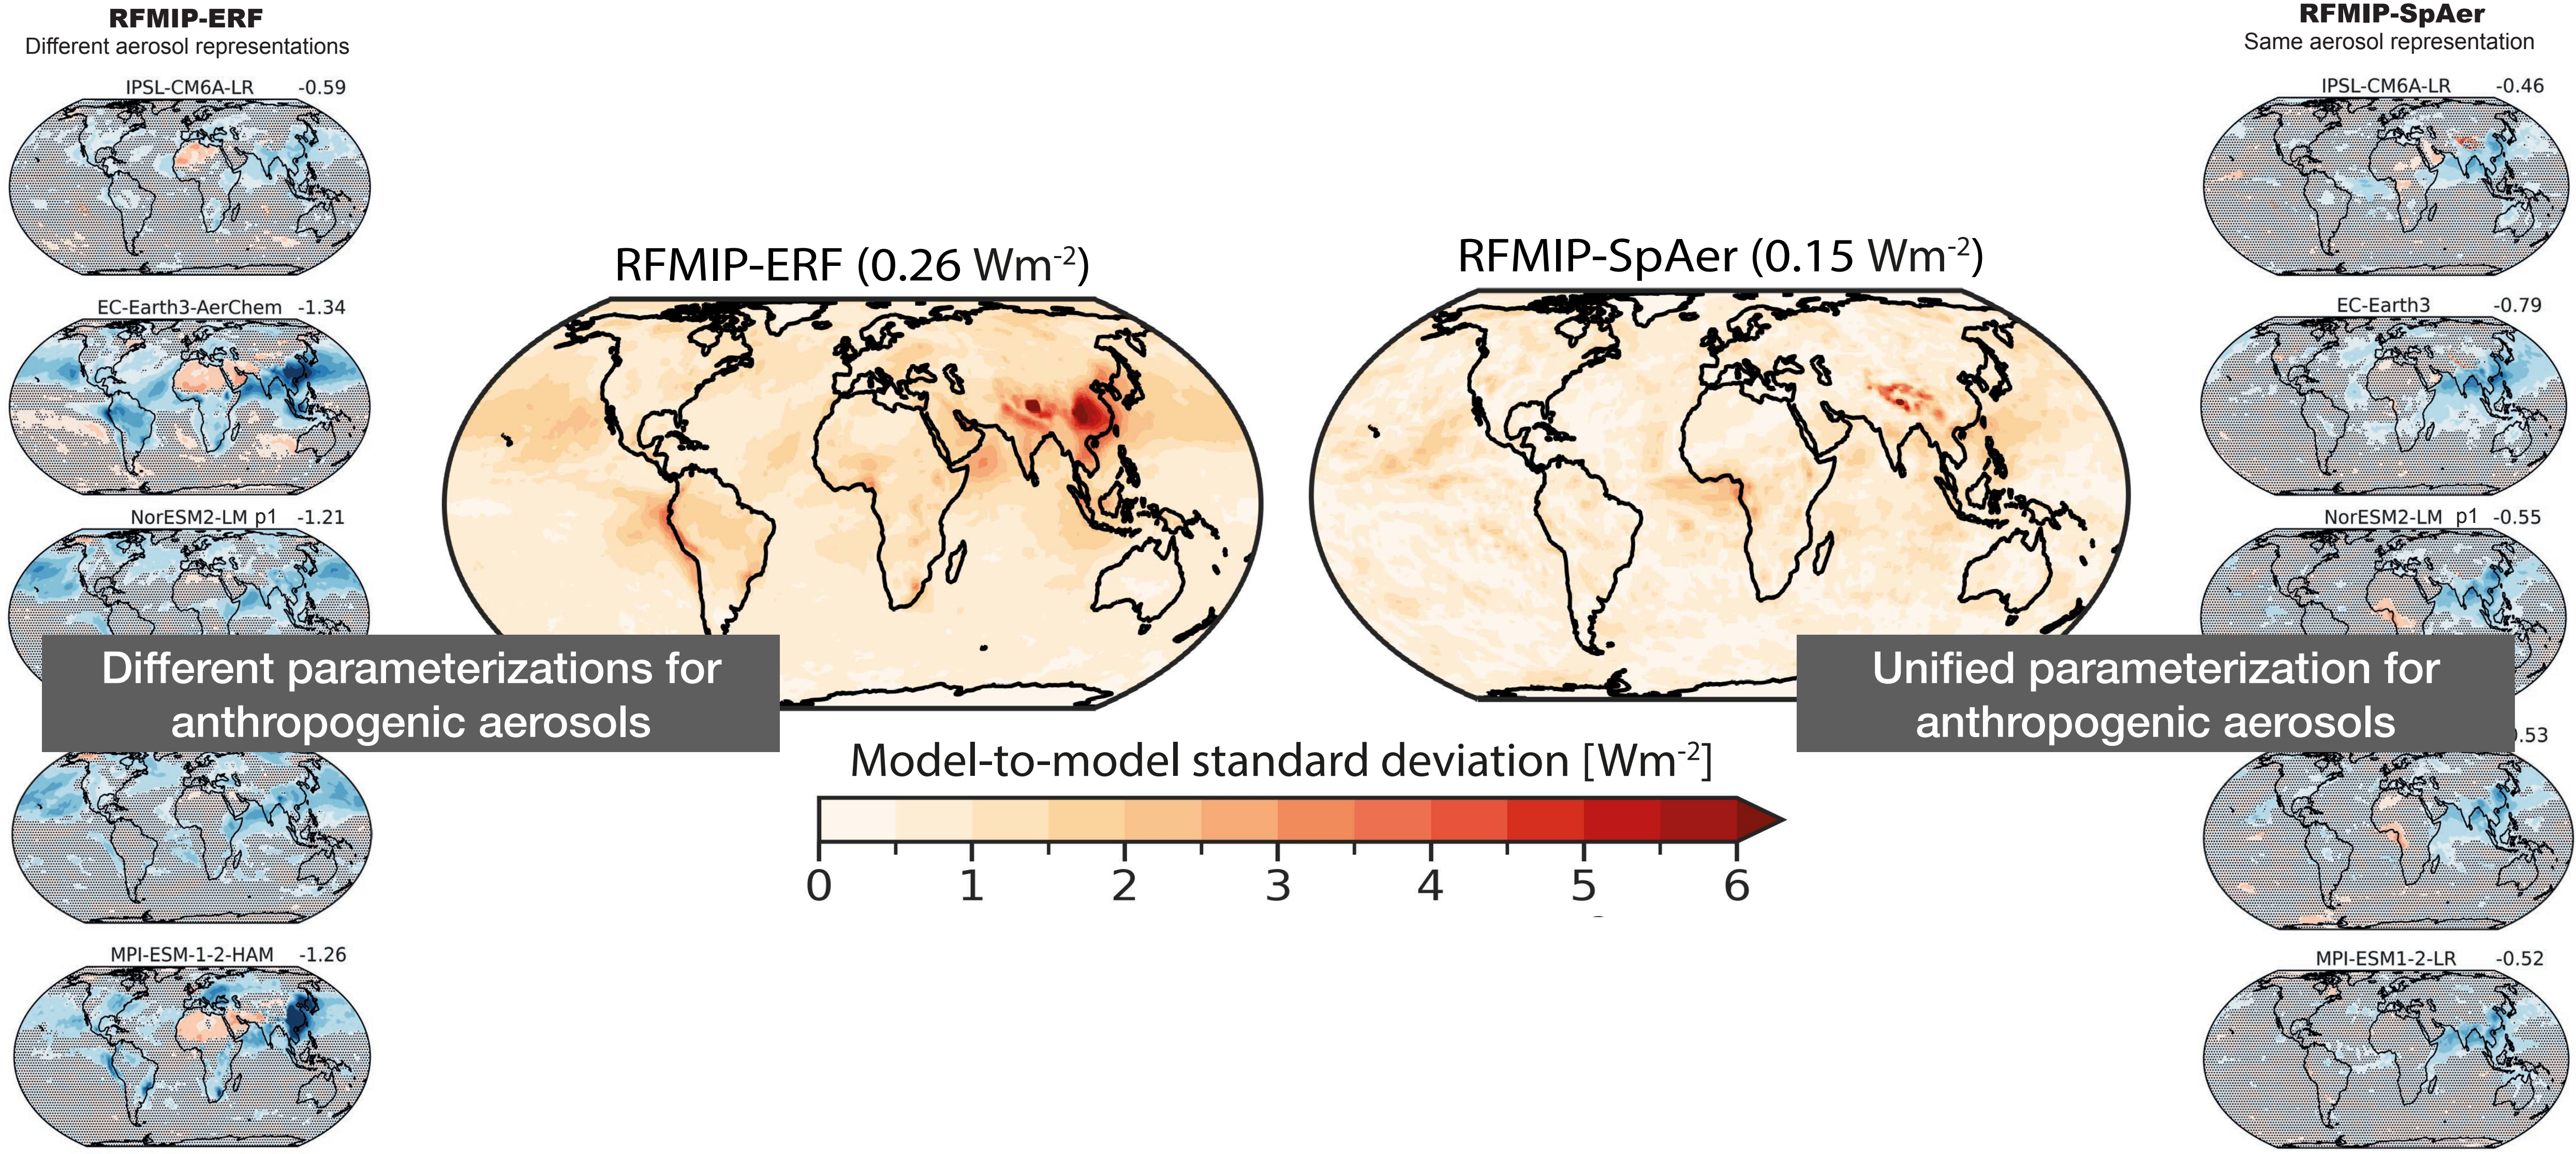

# Unified representation of anthropogenic aerosol properties helps to understand reasons for spread in simulated present-day ERF of anthropogenic aerosols

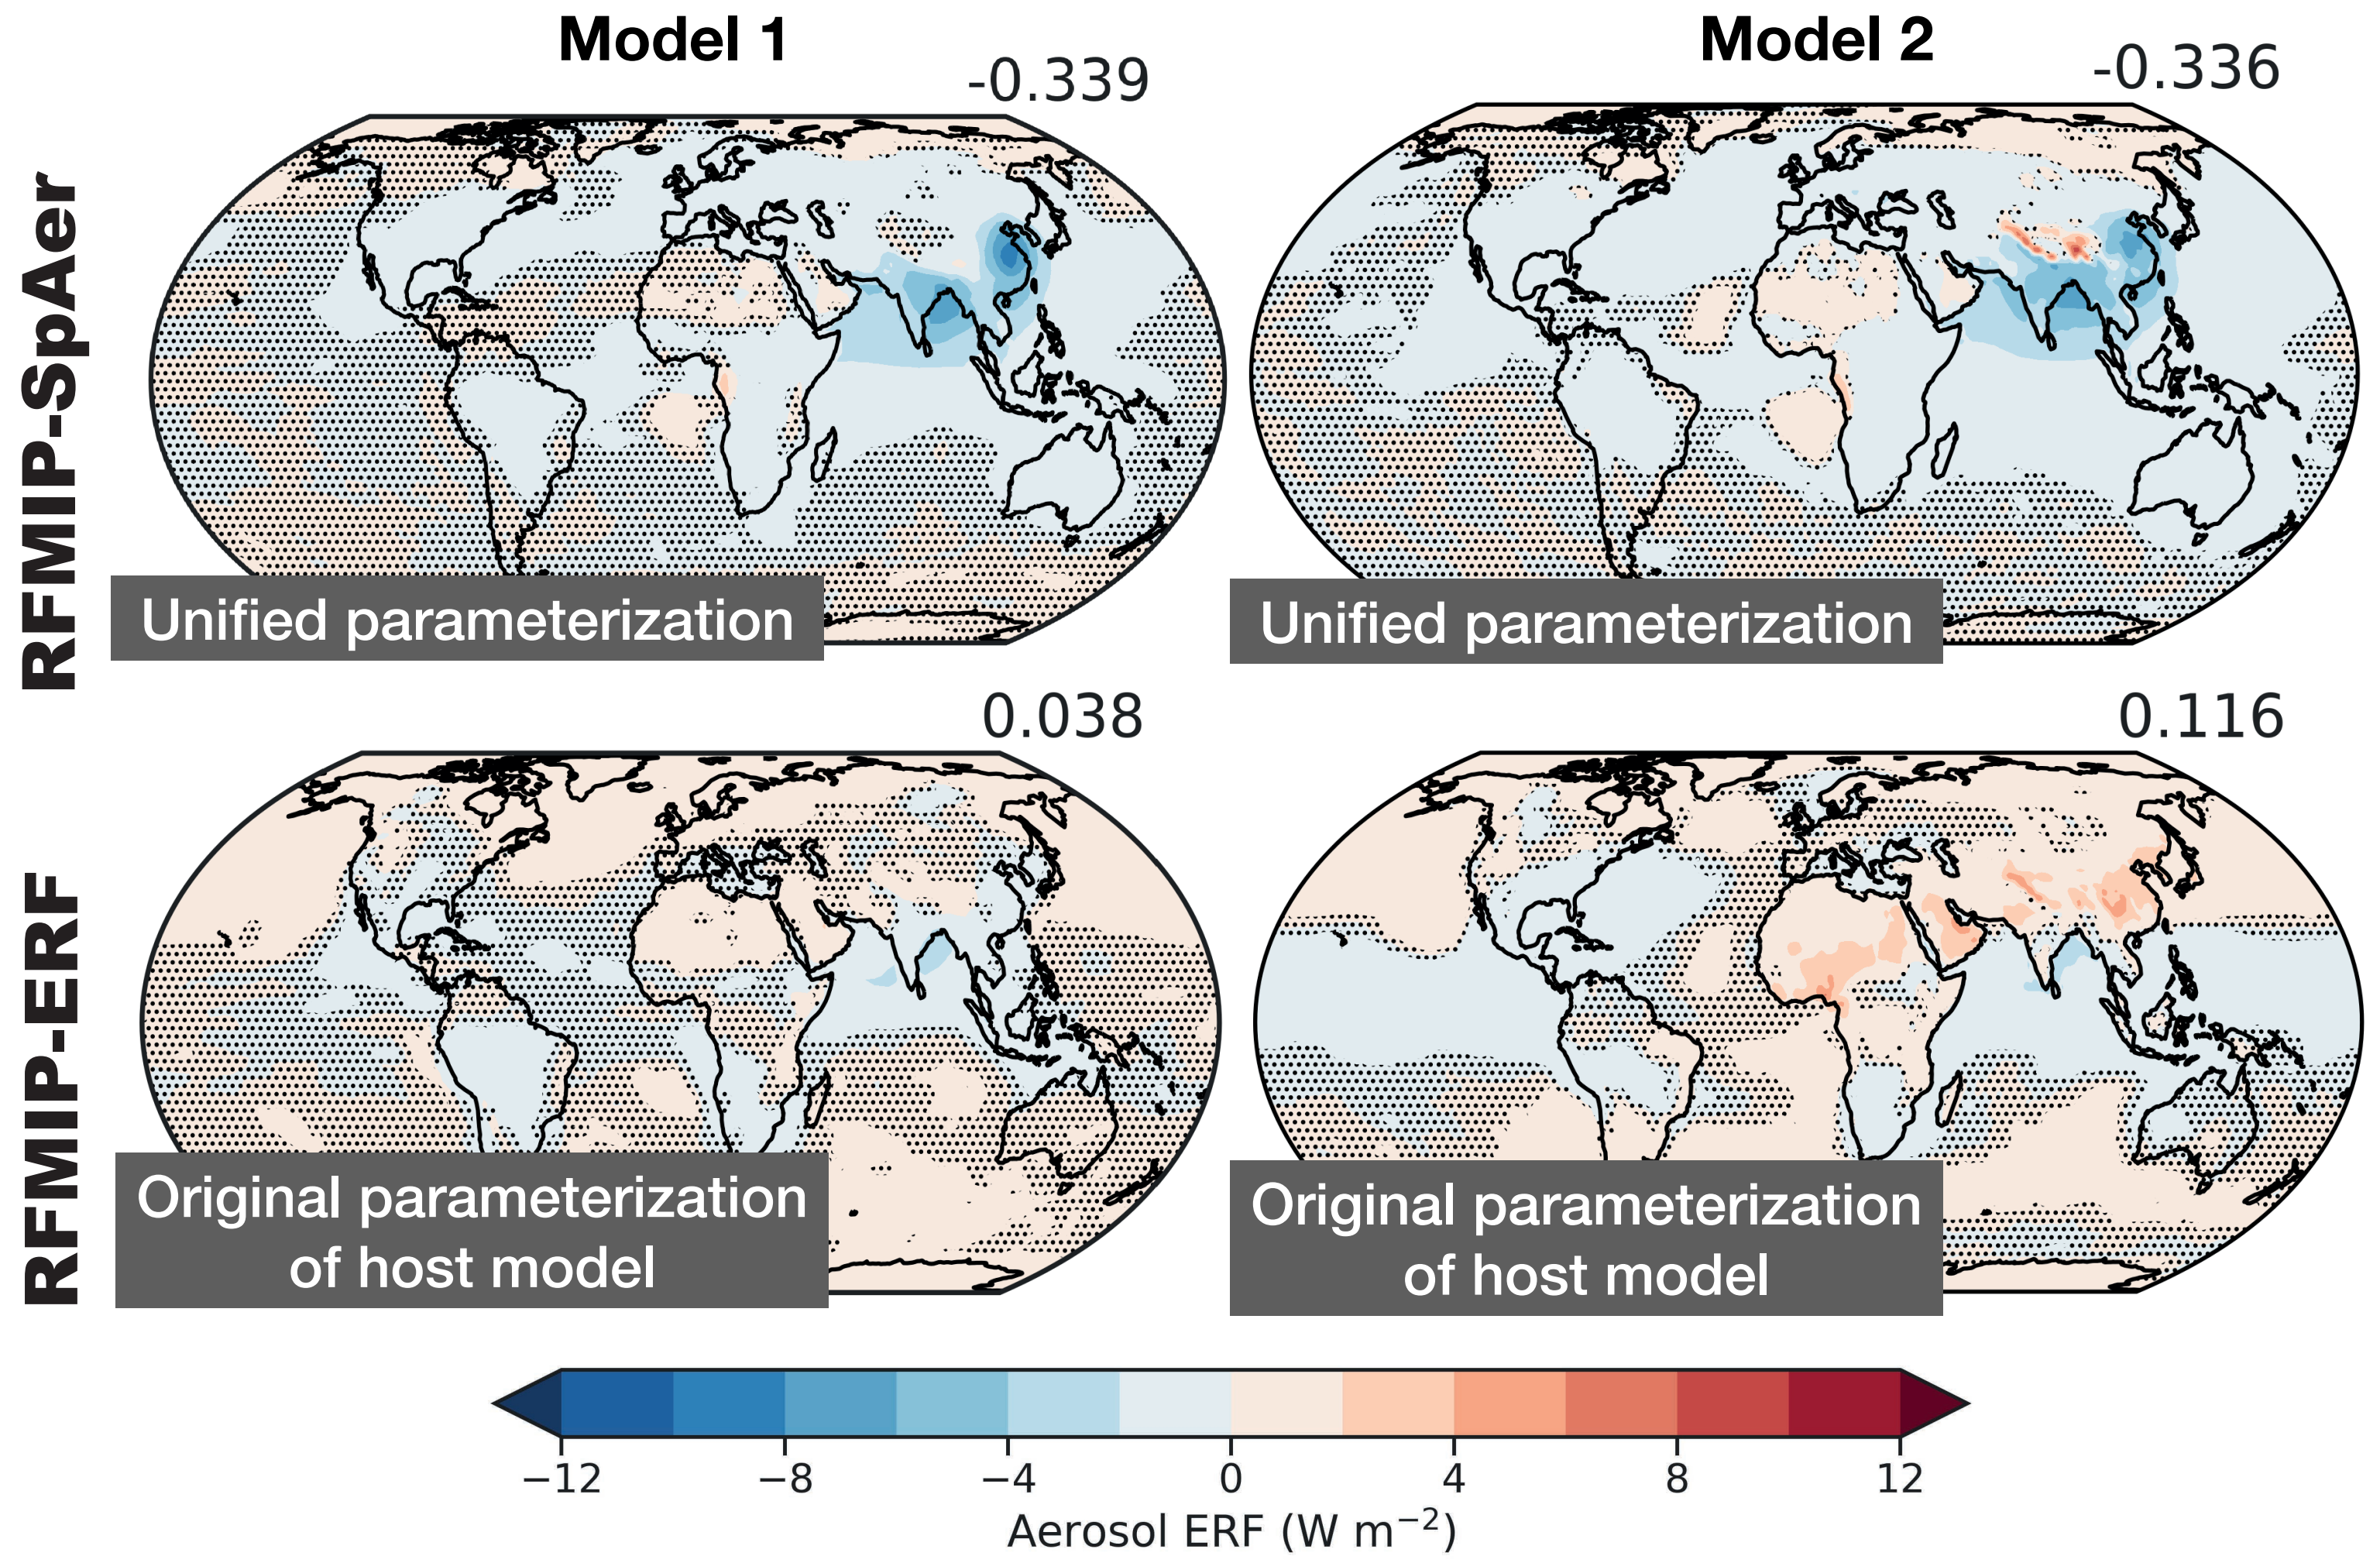

# Unified representation of anthropogenic aerosol properties helps to understand reasons for spread in simulated present-day ERF of anthropogenic aerosols

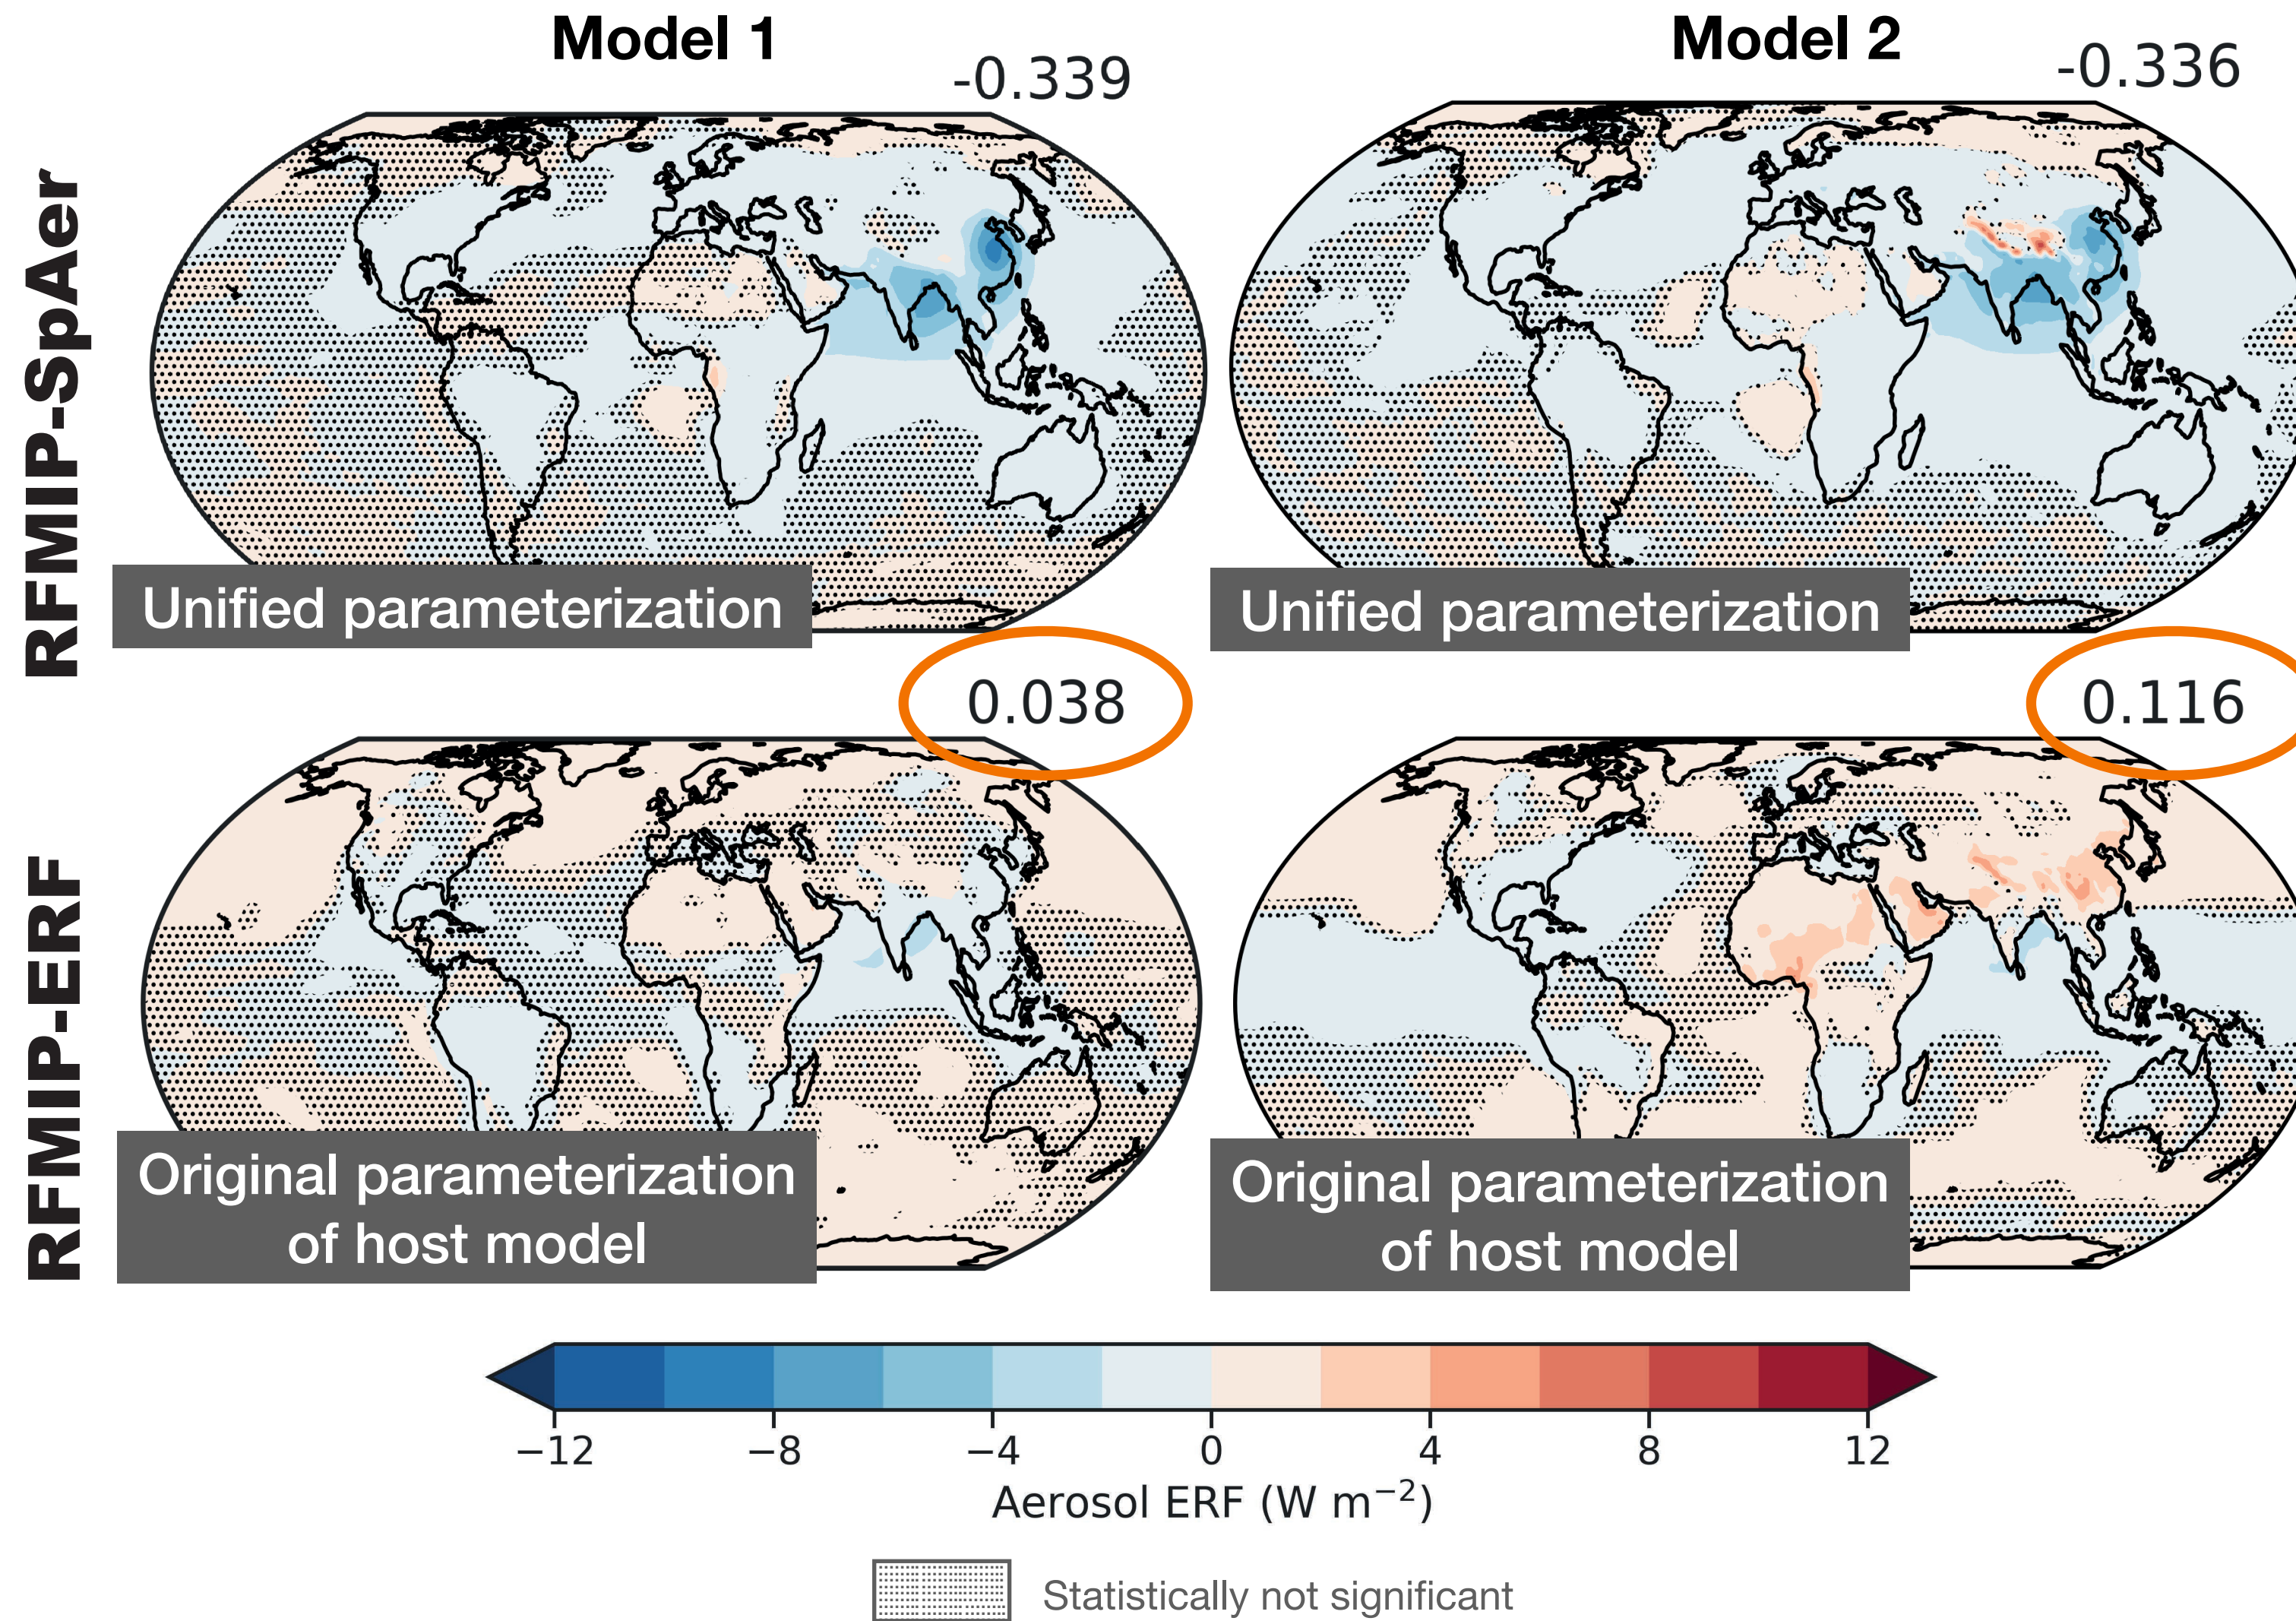

# Additional process separation indicate reasons for model differences in anthropogenic aerosol ERF

 **Direct effects**

# Additional process separation indicate reasons for model differences in anthropogenic aerosol ERF

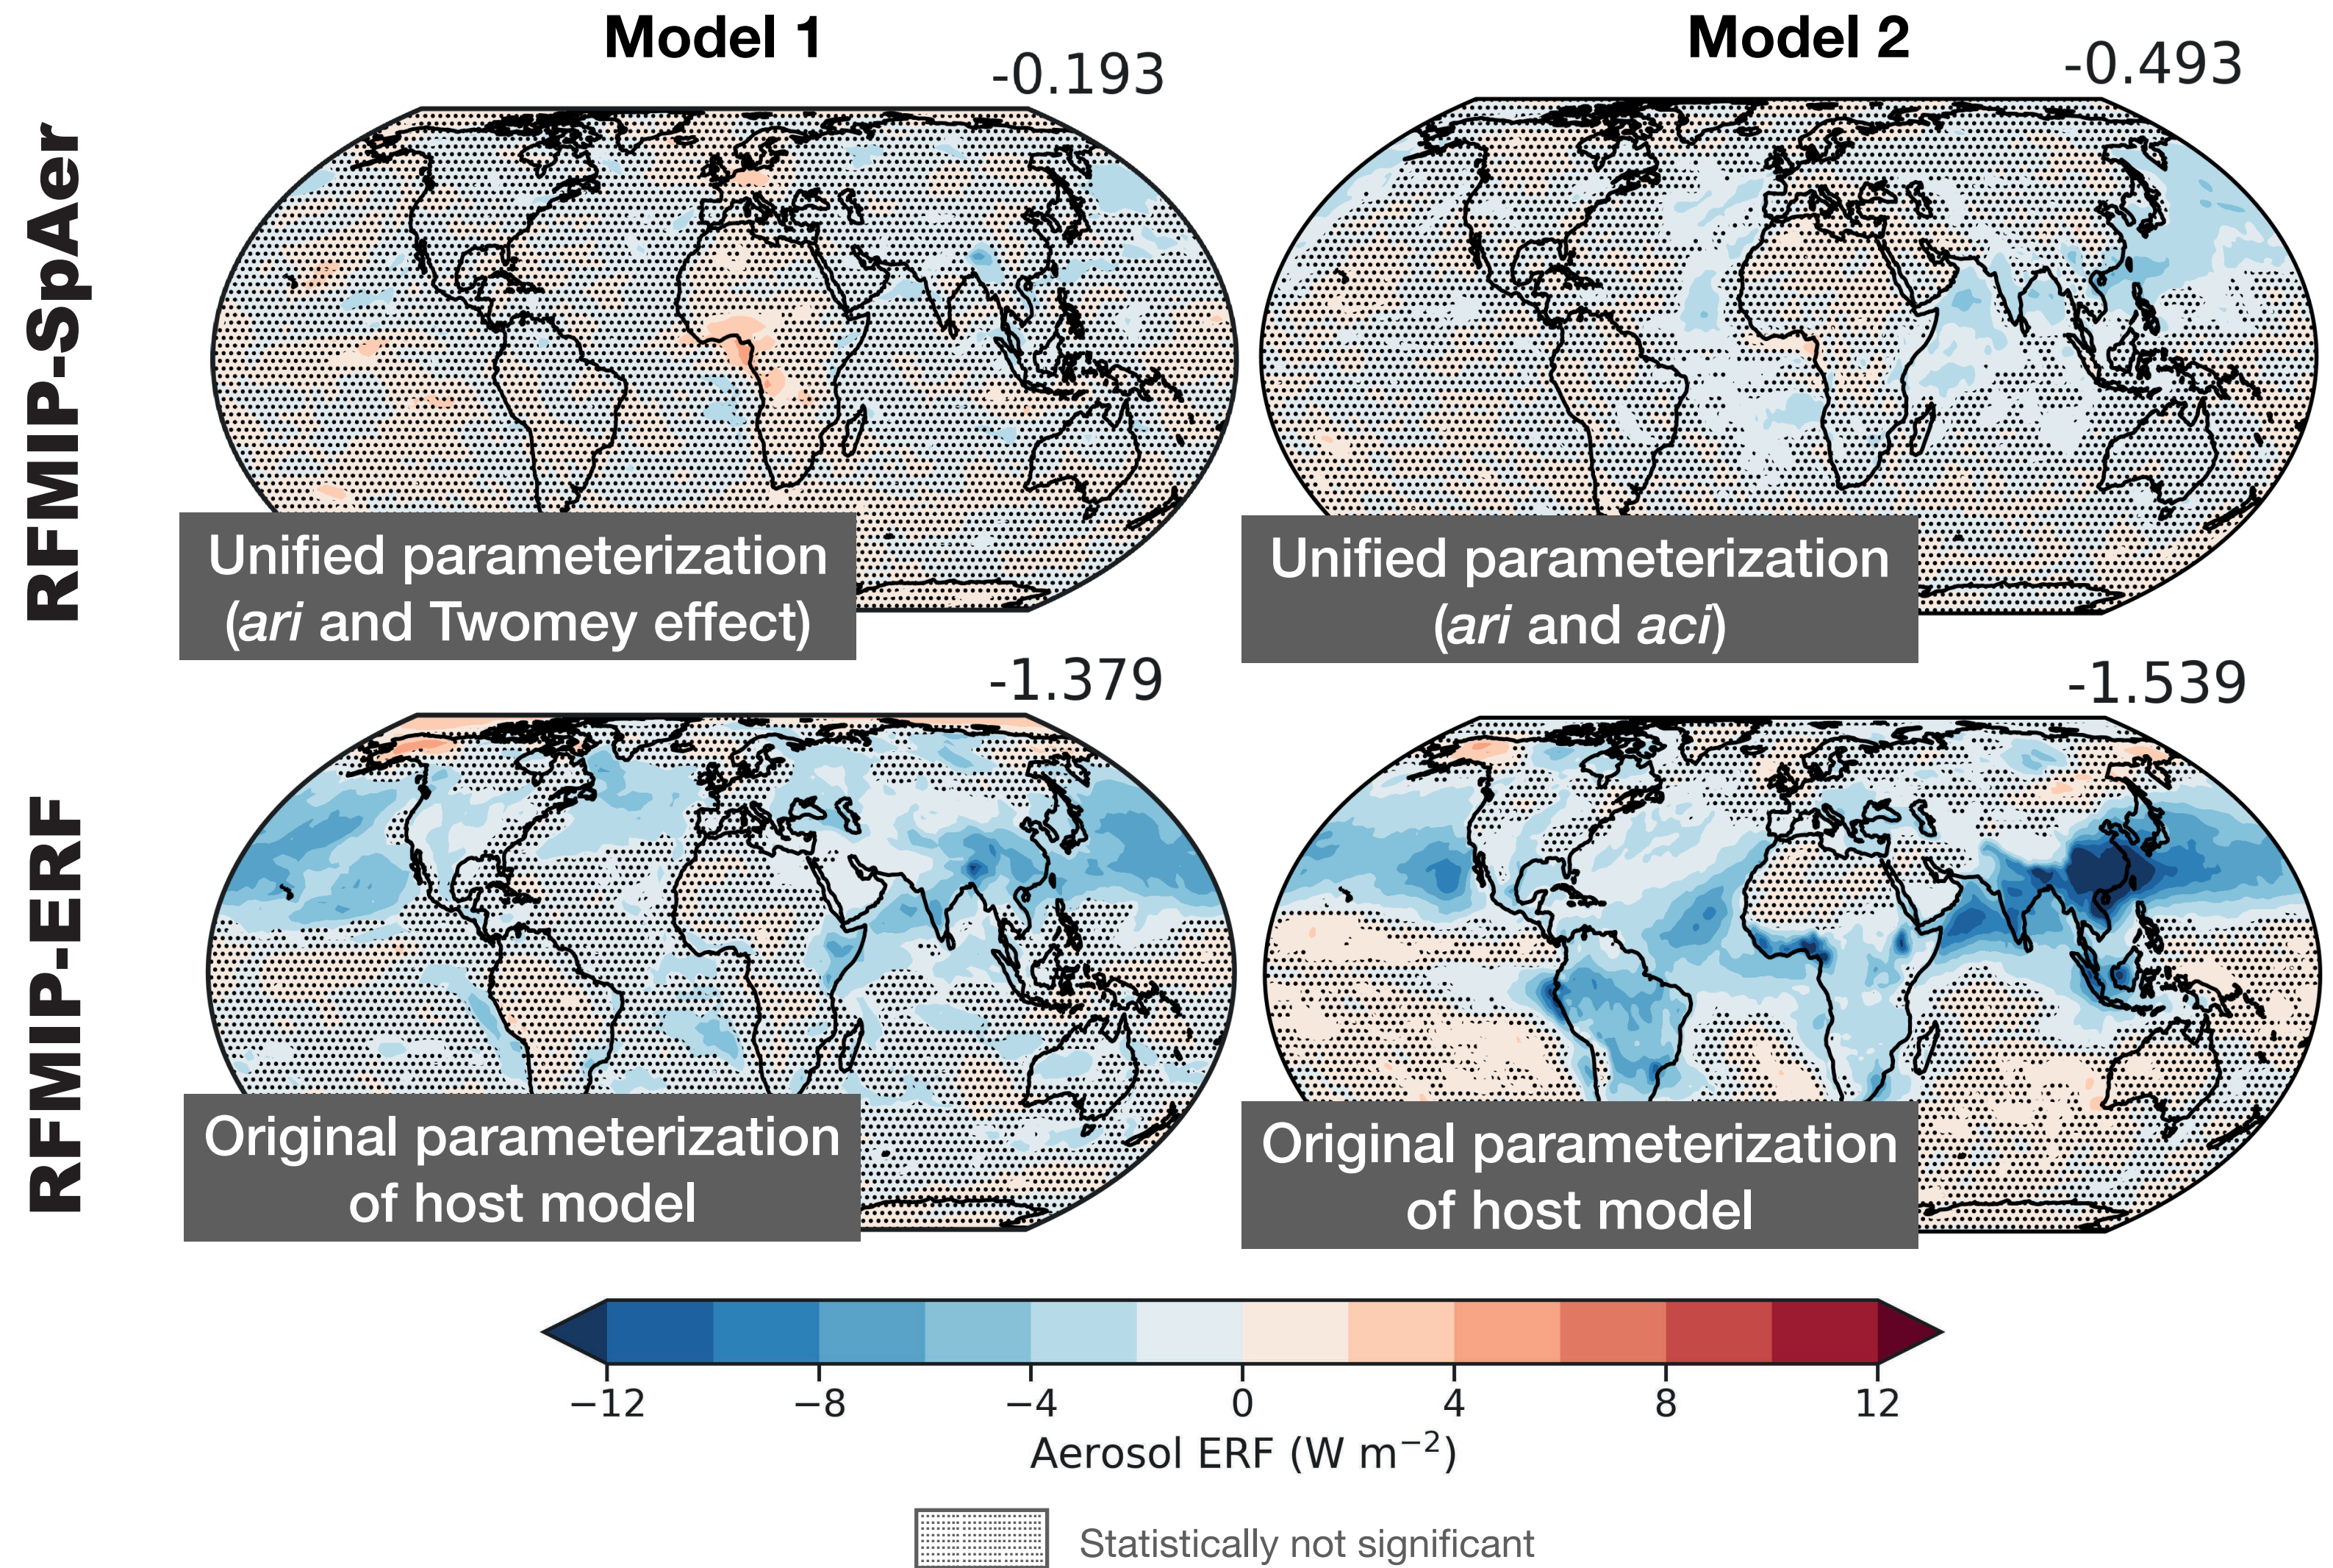

Positive direct aerosol radiative effects in CMIP6 models are associated with strong aerosol absorption

# Additional process separation indicate reasons for model differences in anthropogenic aerosol ERF

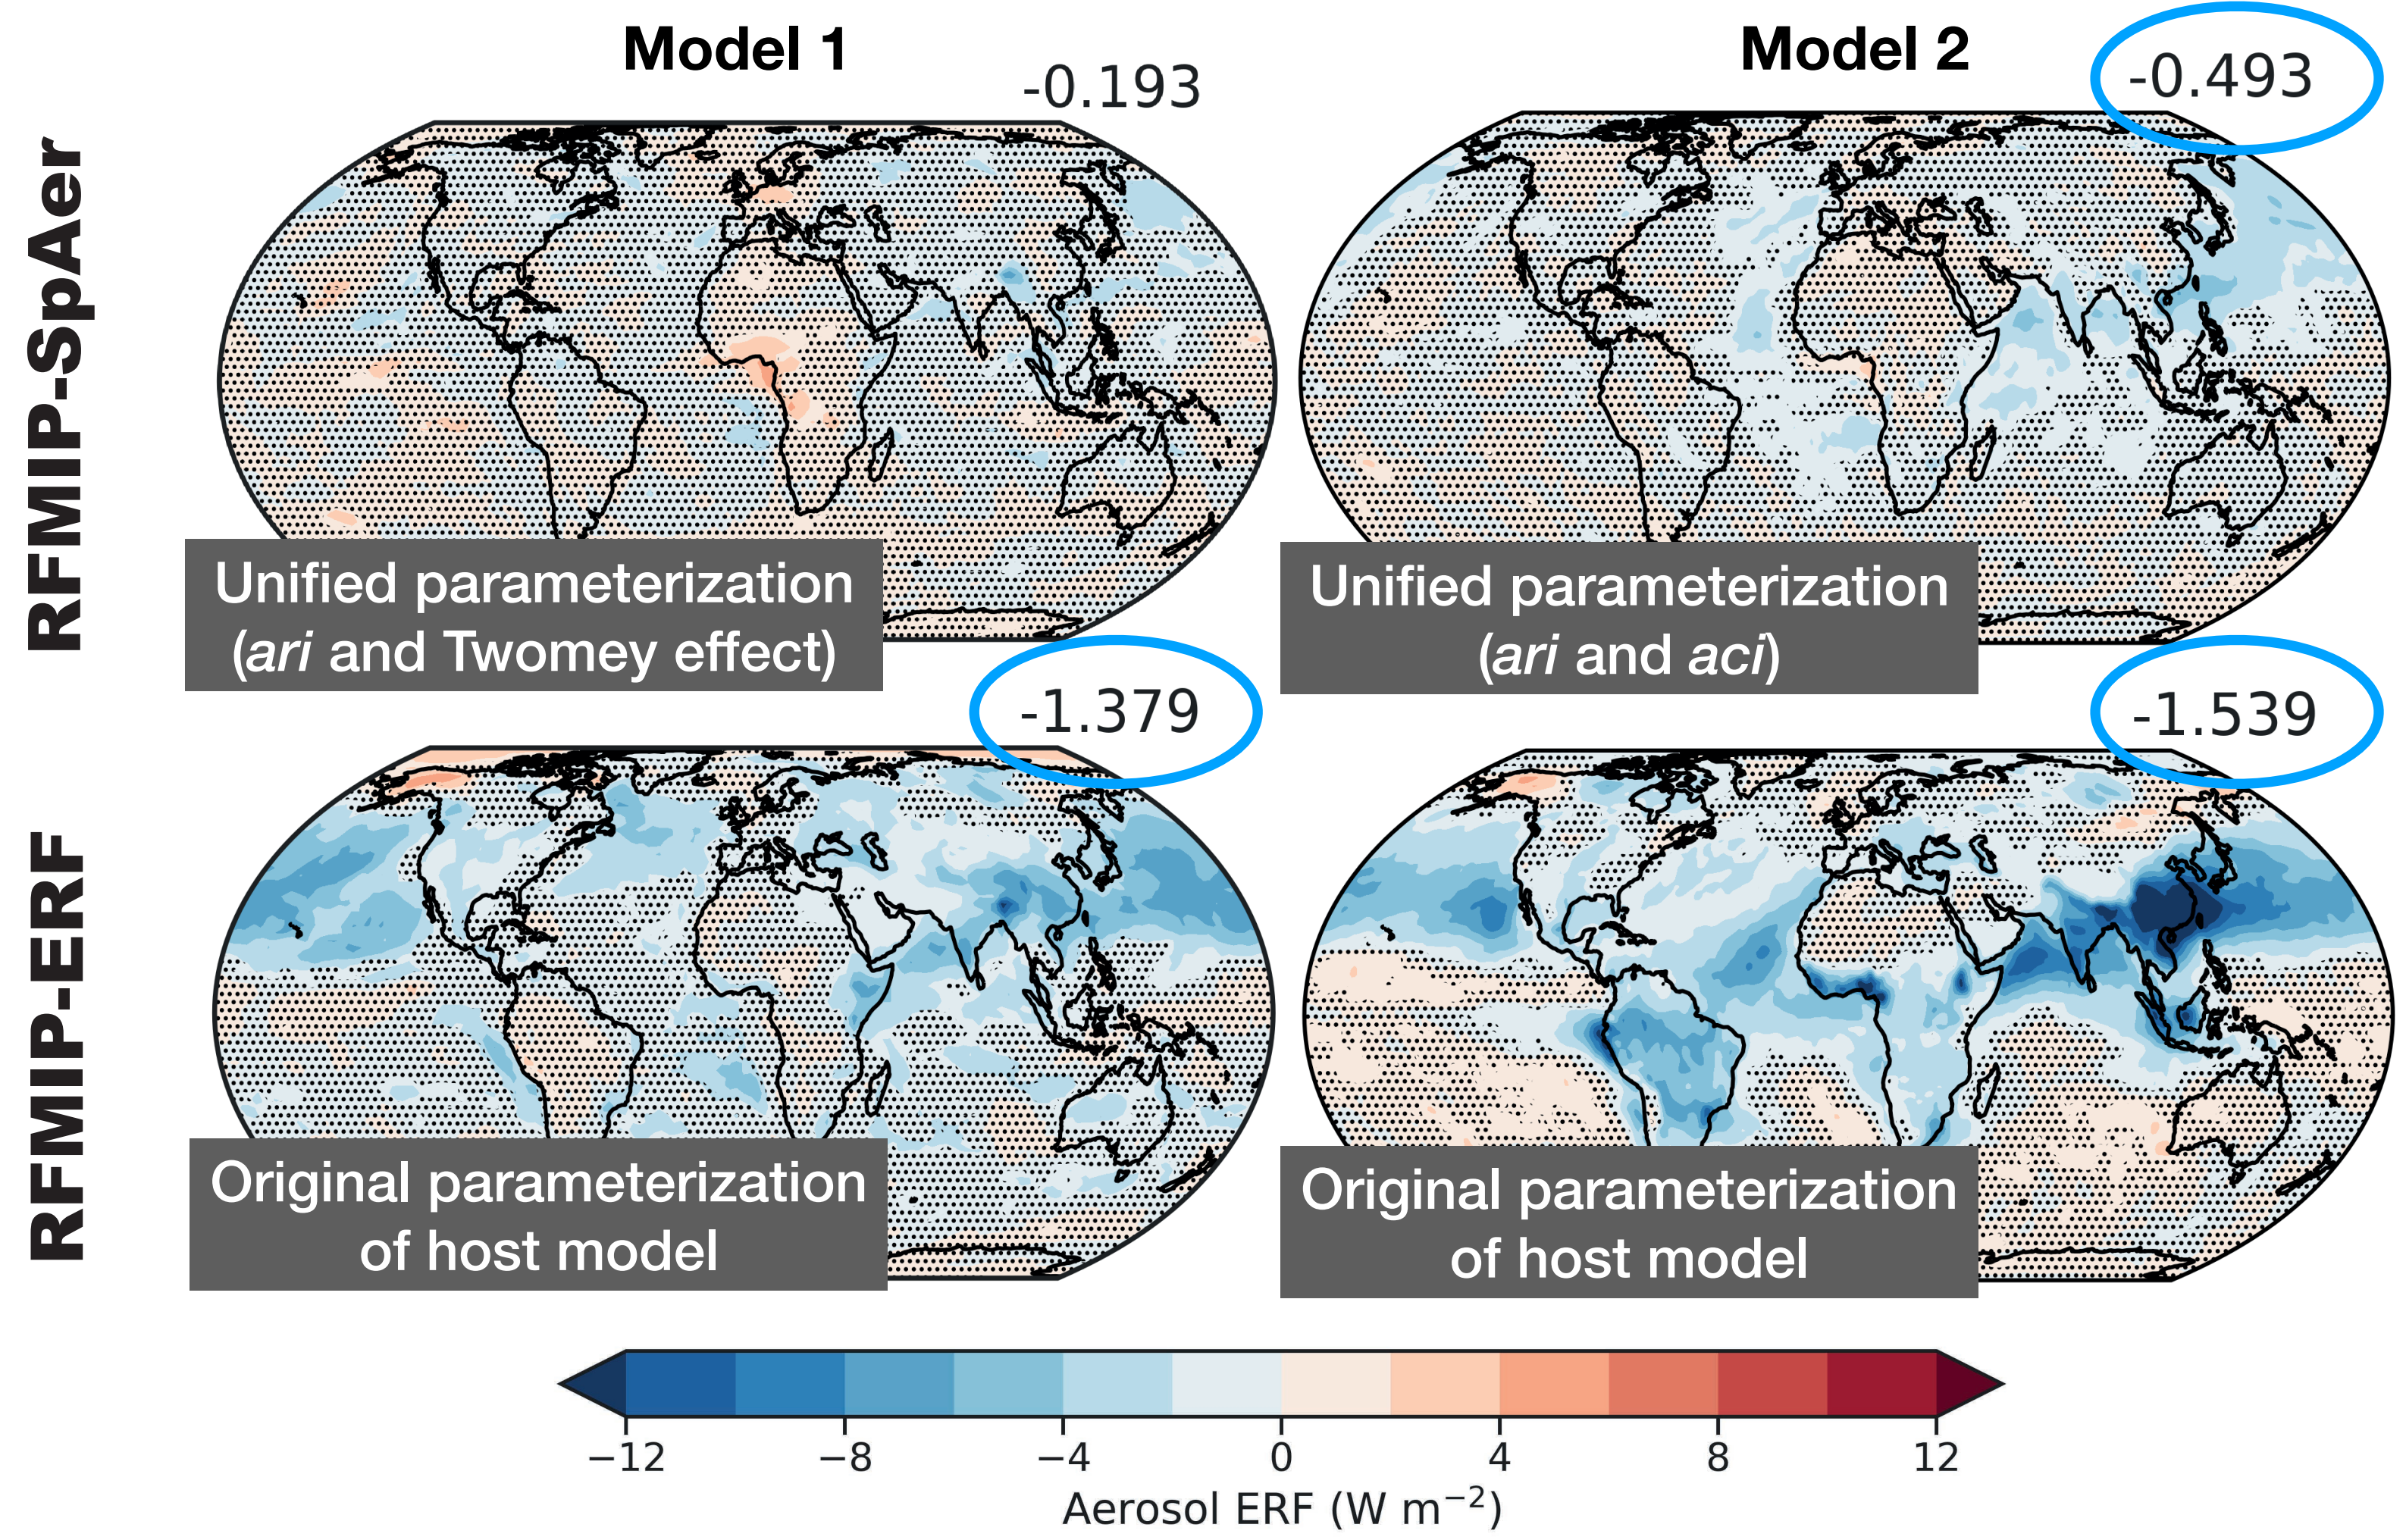

## Cloud-mediated effects

# Additional process separation indicate reasons for model differences in anthropogenic aerosol ERF

## Cloud-mediated effects

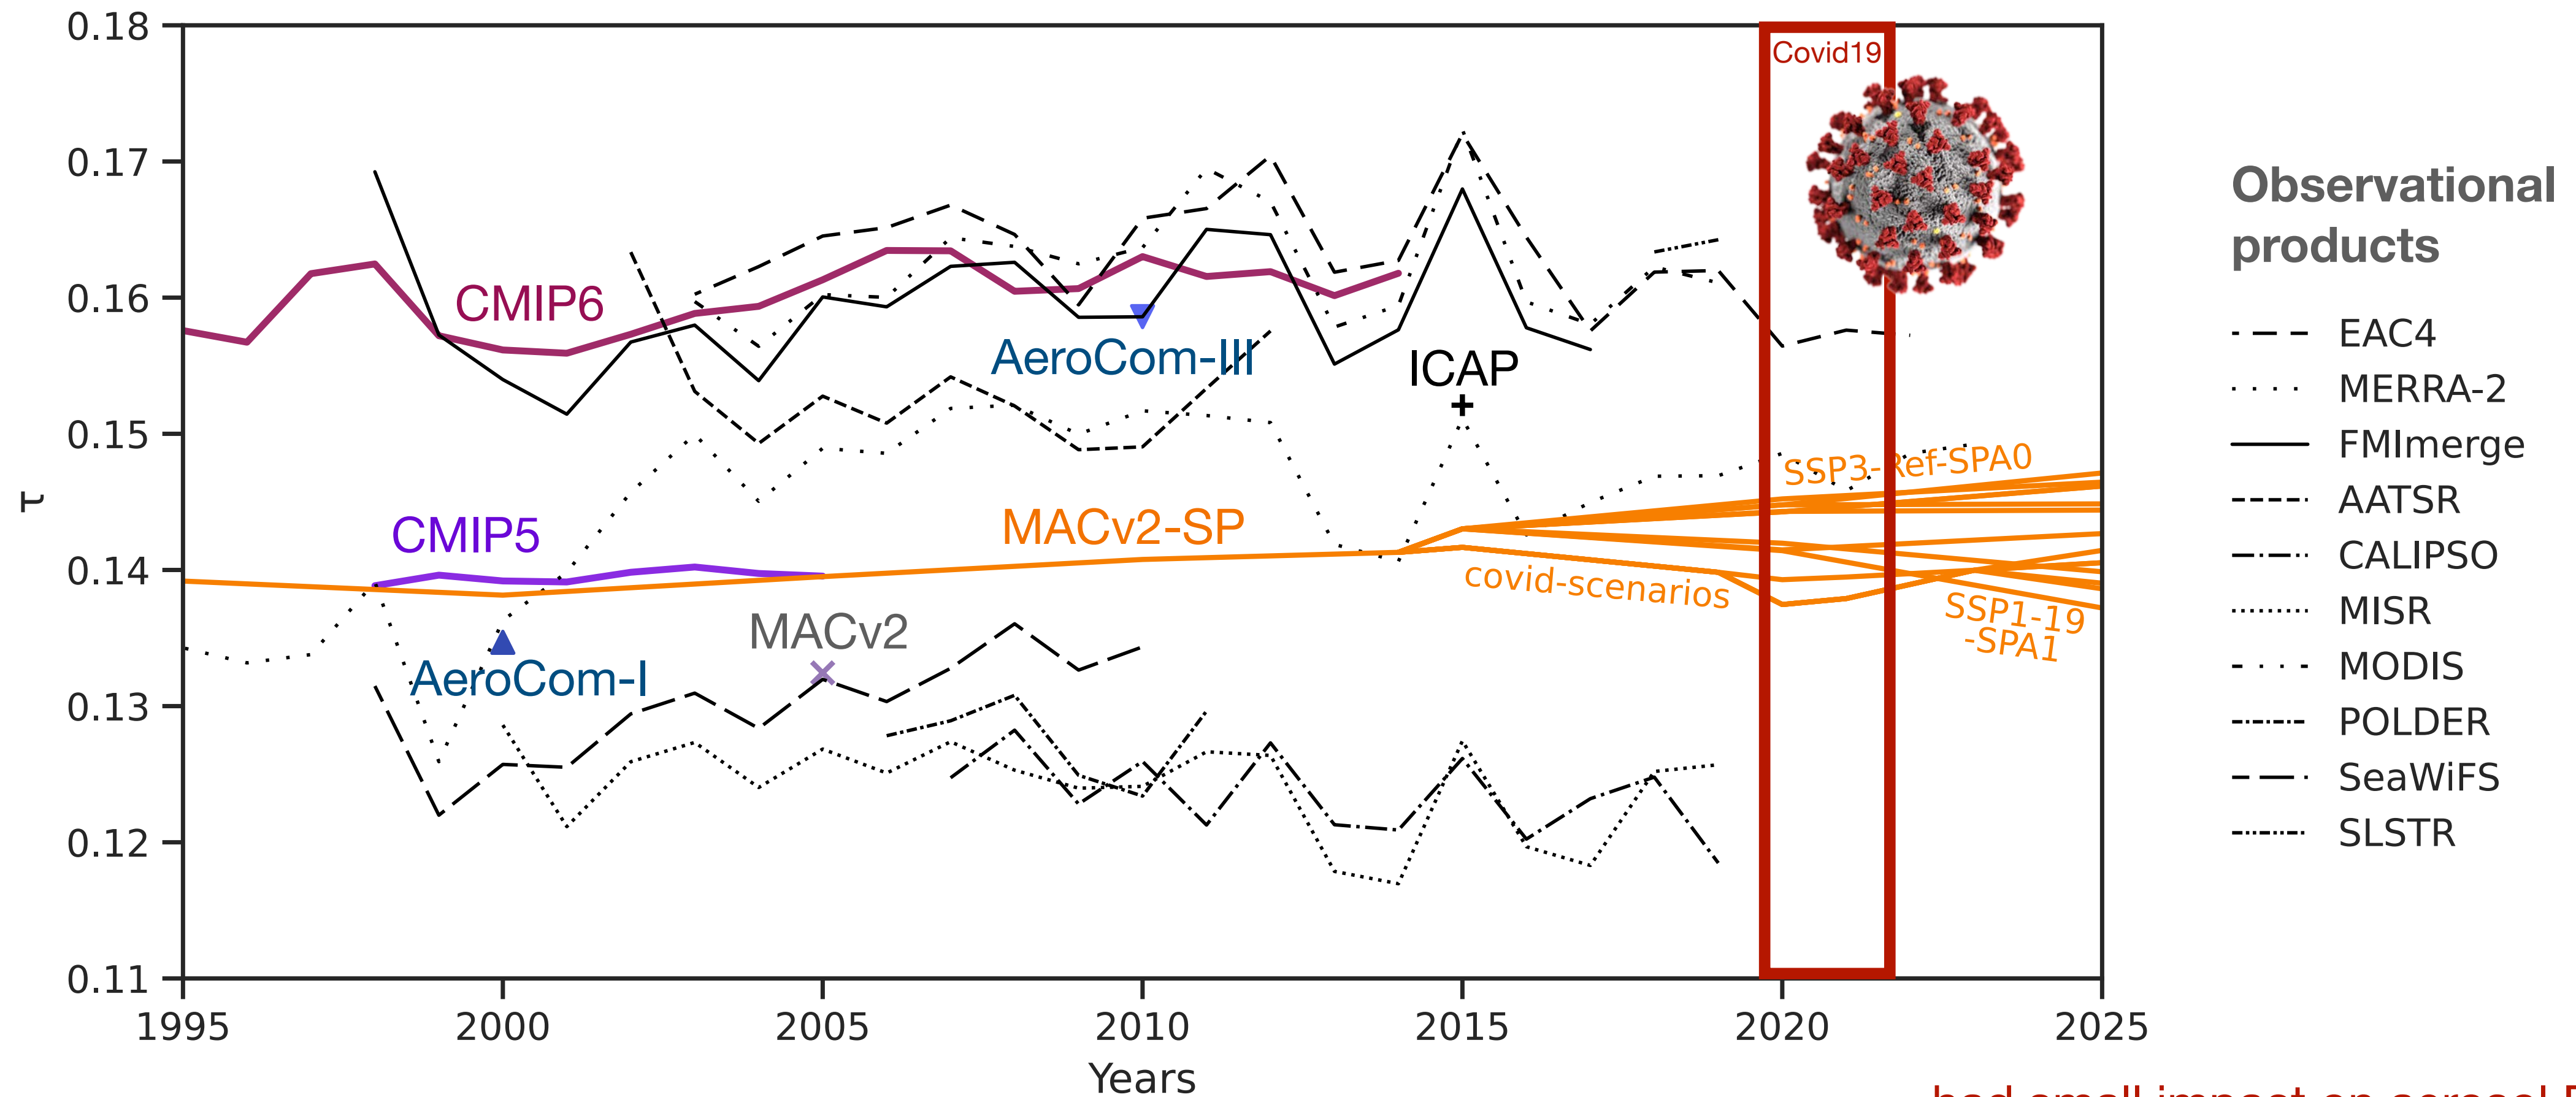

Diverse and often strong cloud-mediated effects primarily determine the magnitude of aerosol ERF in CMIP6

# Data differences for total aerosol optical depth

... had small impact on aerosol ERF  
Fiedler et al. (2021)

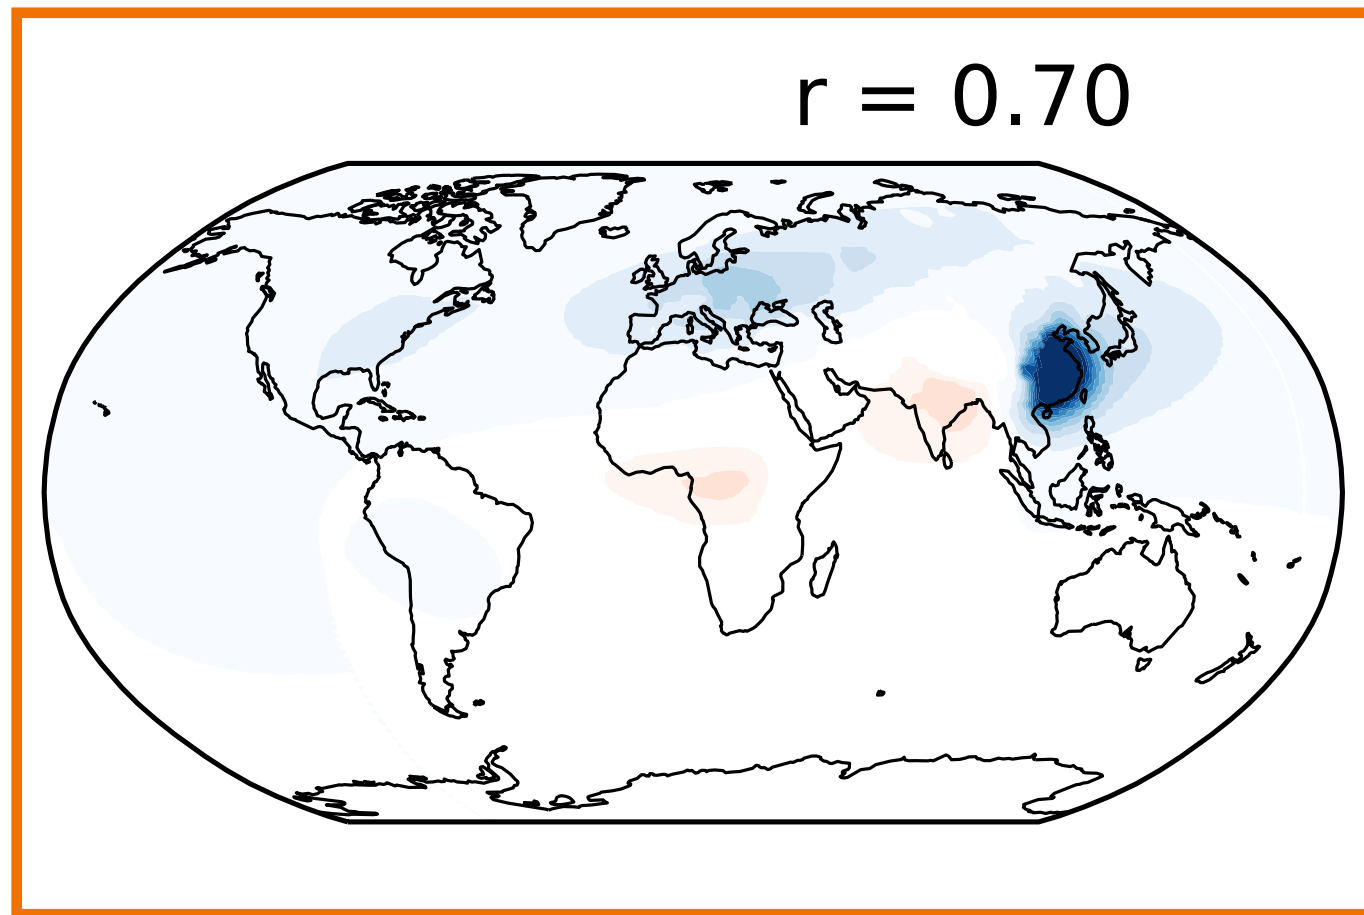

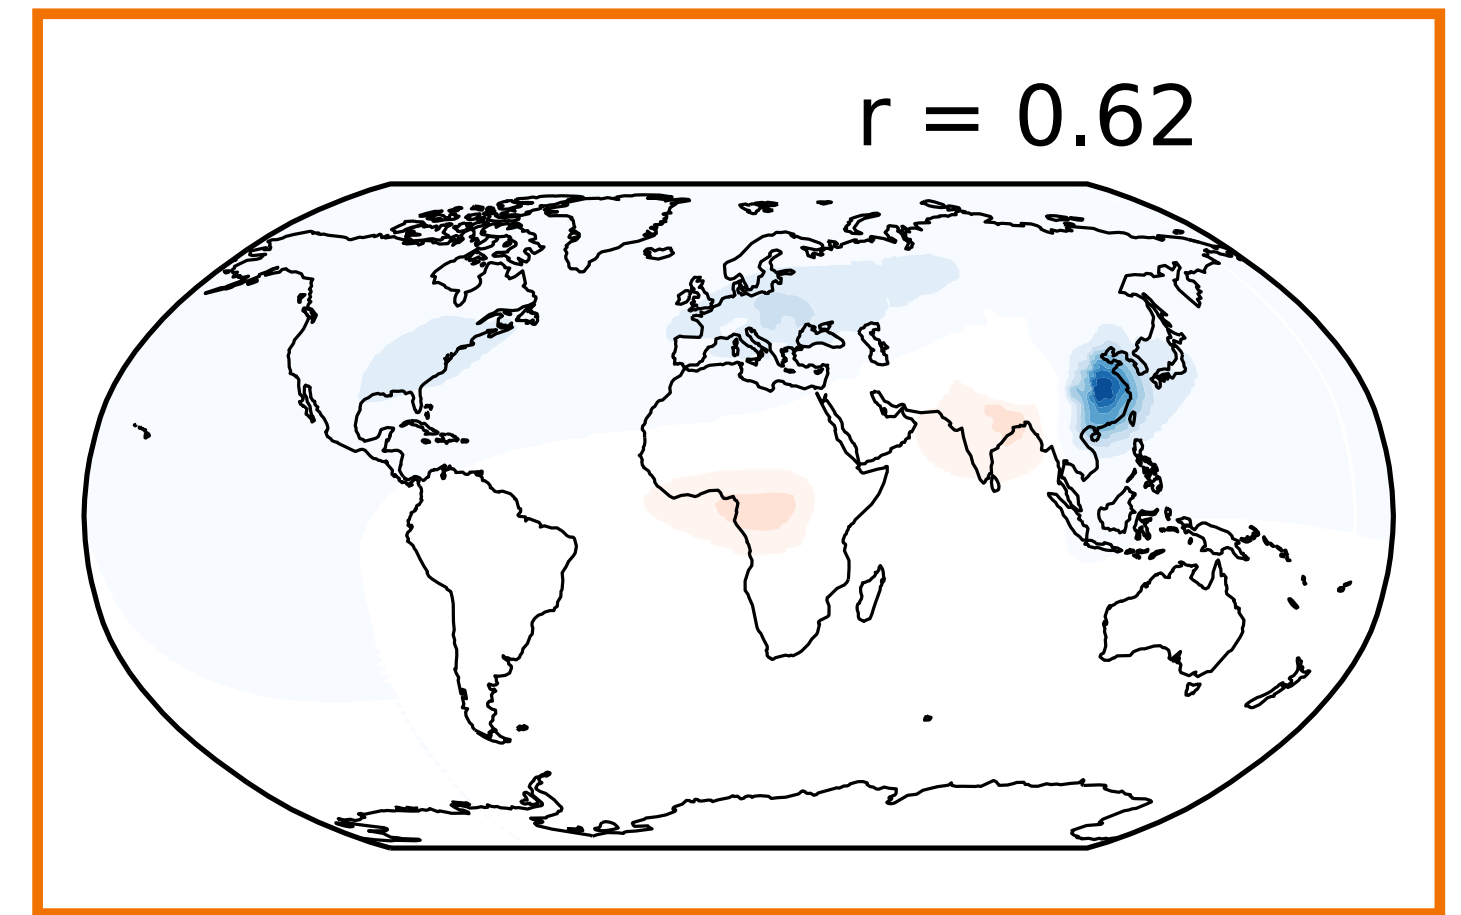

# What scenario is closest to the observed pattern of the 2010-2022 trend in aerosol optical depth?

With CovidMIP Scenarios

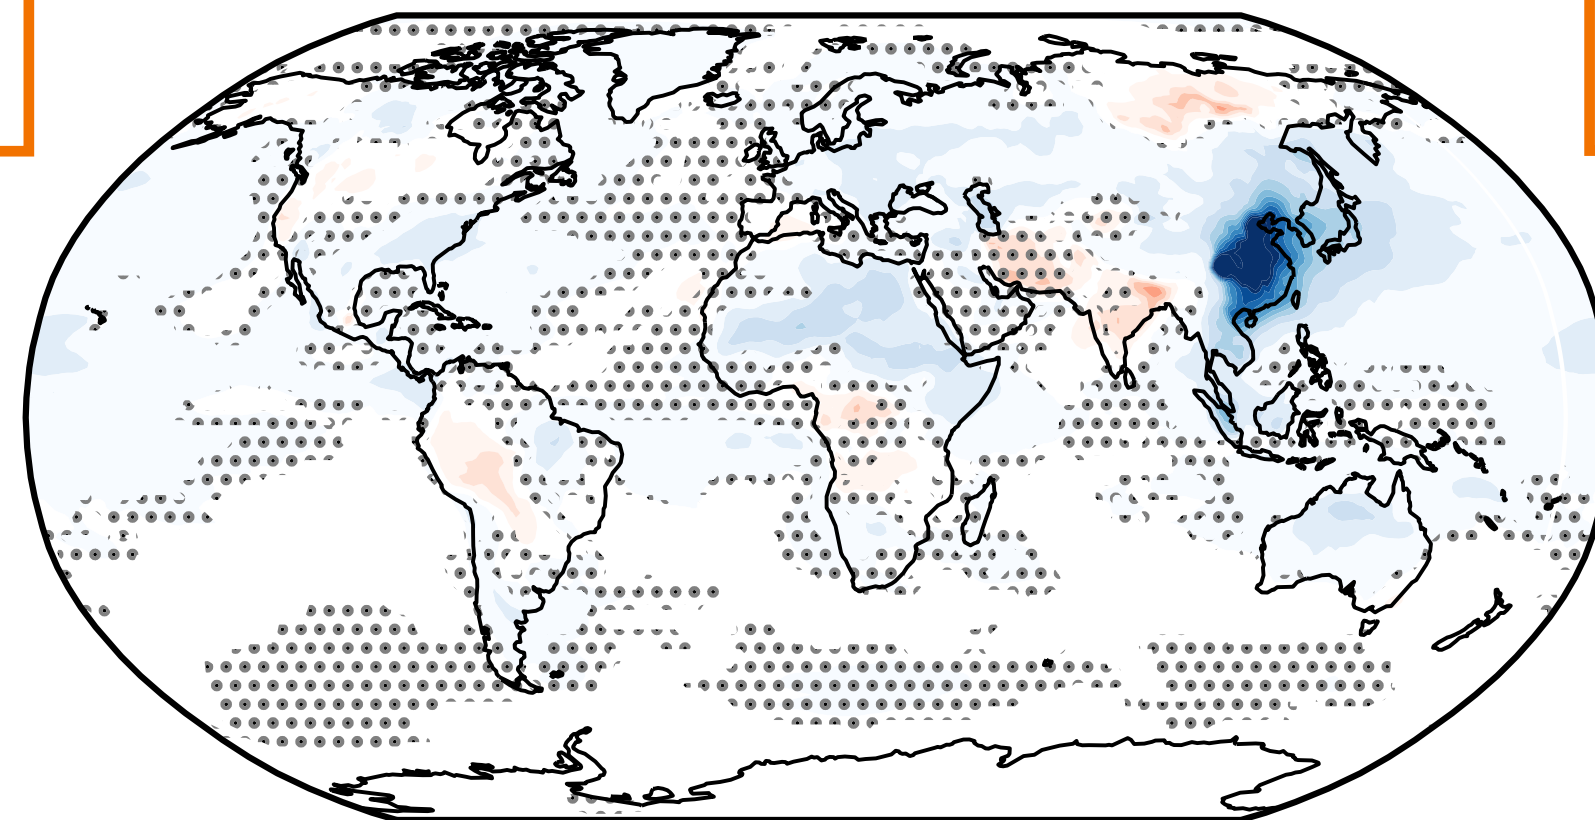

Historical data from Stevens et al. (2017)  
Scenarios from Fiedler et al. (2021)

Best CMIP6 Scenario

Historical data from Stevens et al. (2017)  
Scenarios from Fiedler et al. (2019)

Observations

Data collection following Vogel et al. (2022)

Fiedler et al. (in prep.)

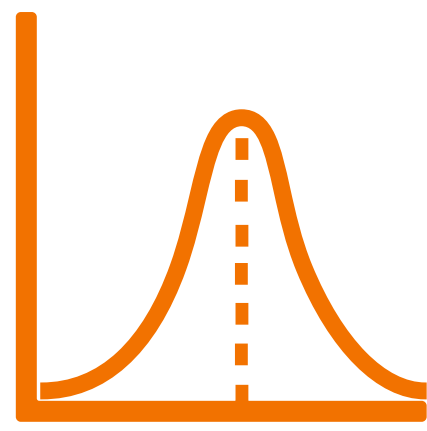

# What changes do we expect compared to CMIP6? (Based on preliminary CMIP6plus emission data)

## Anthropogenic aerosol optical depth in plume centers

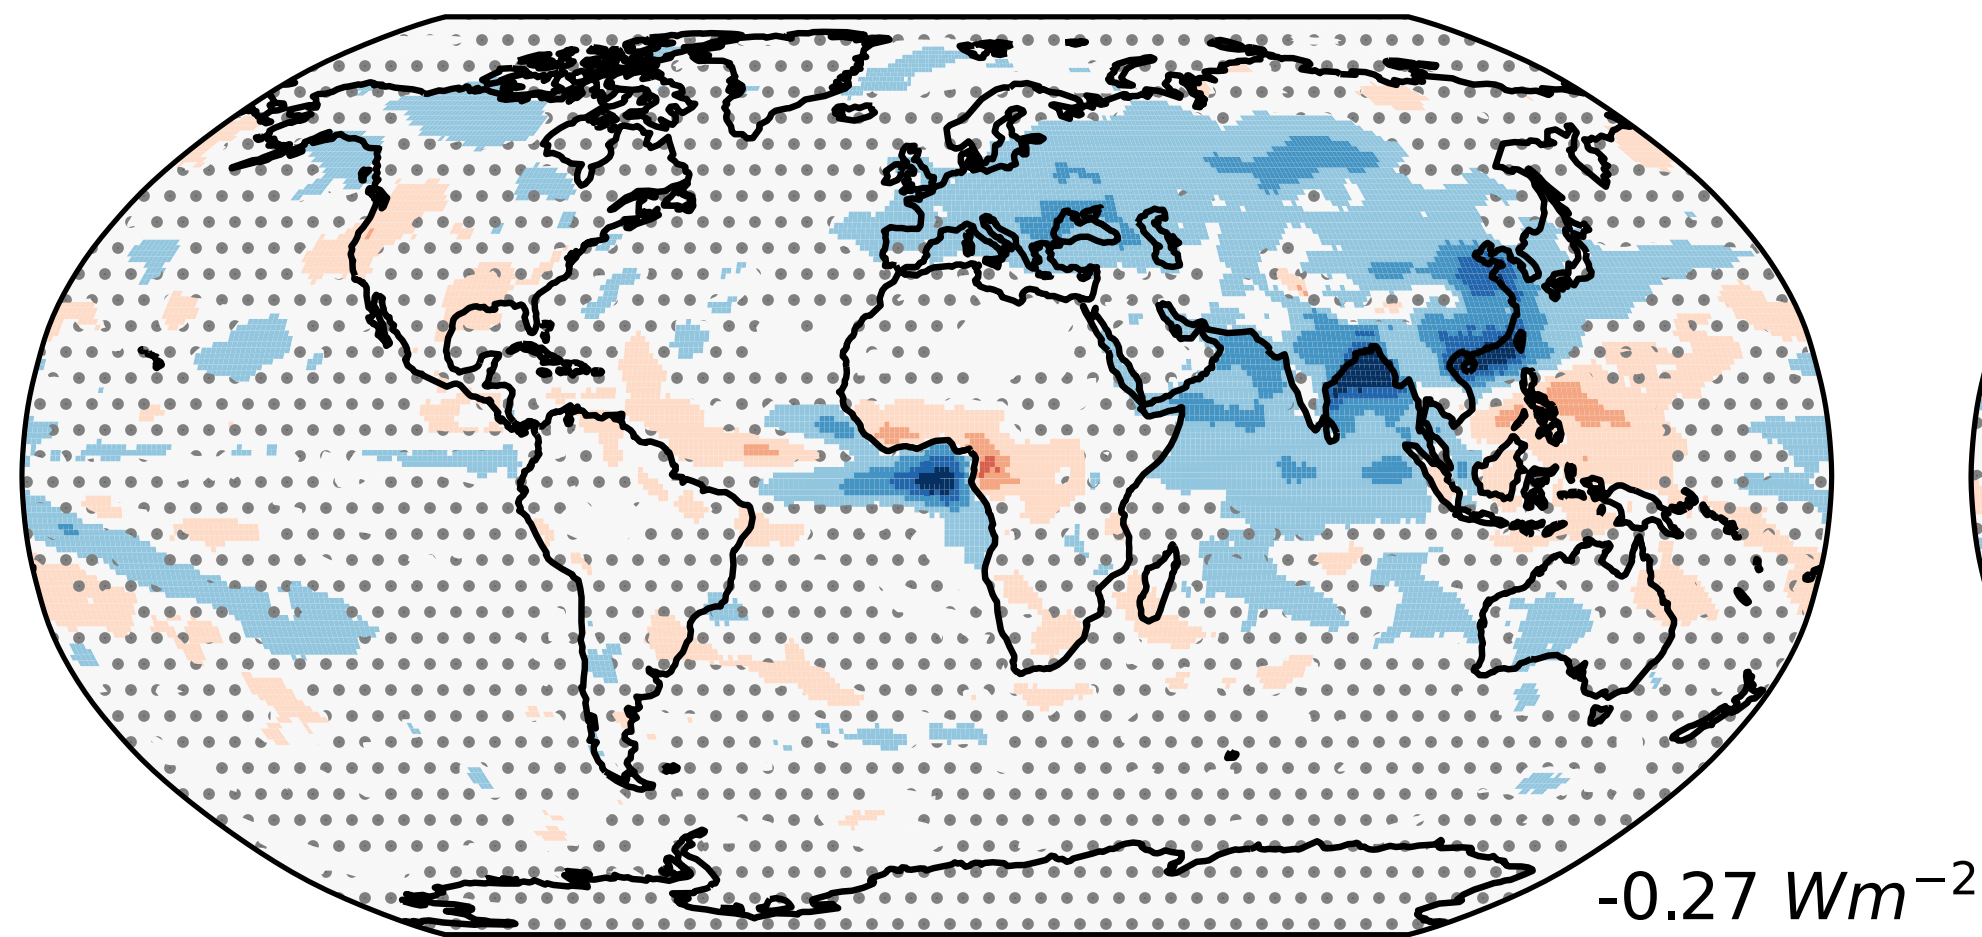

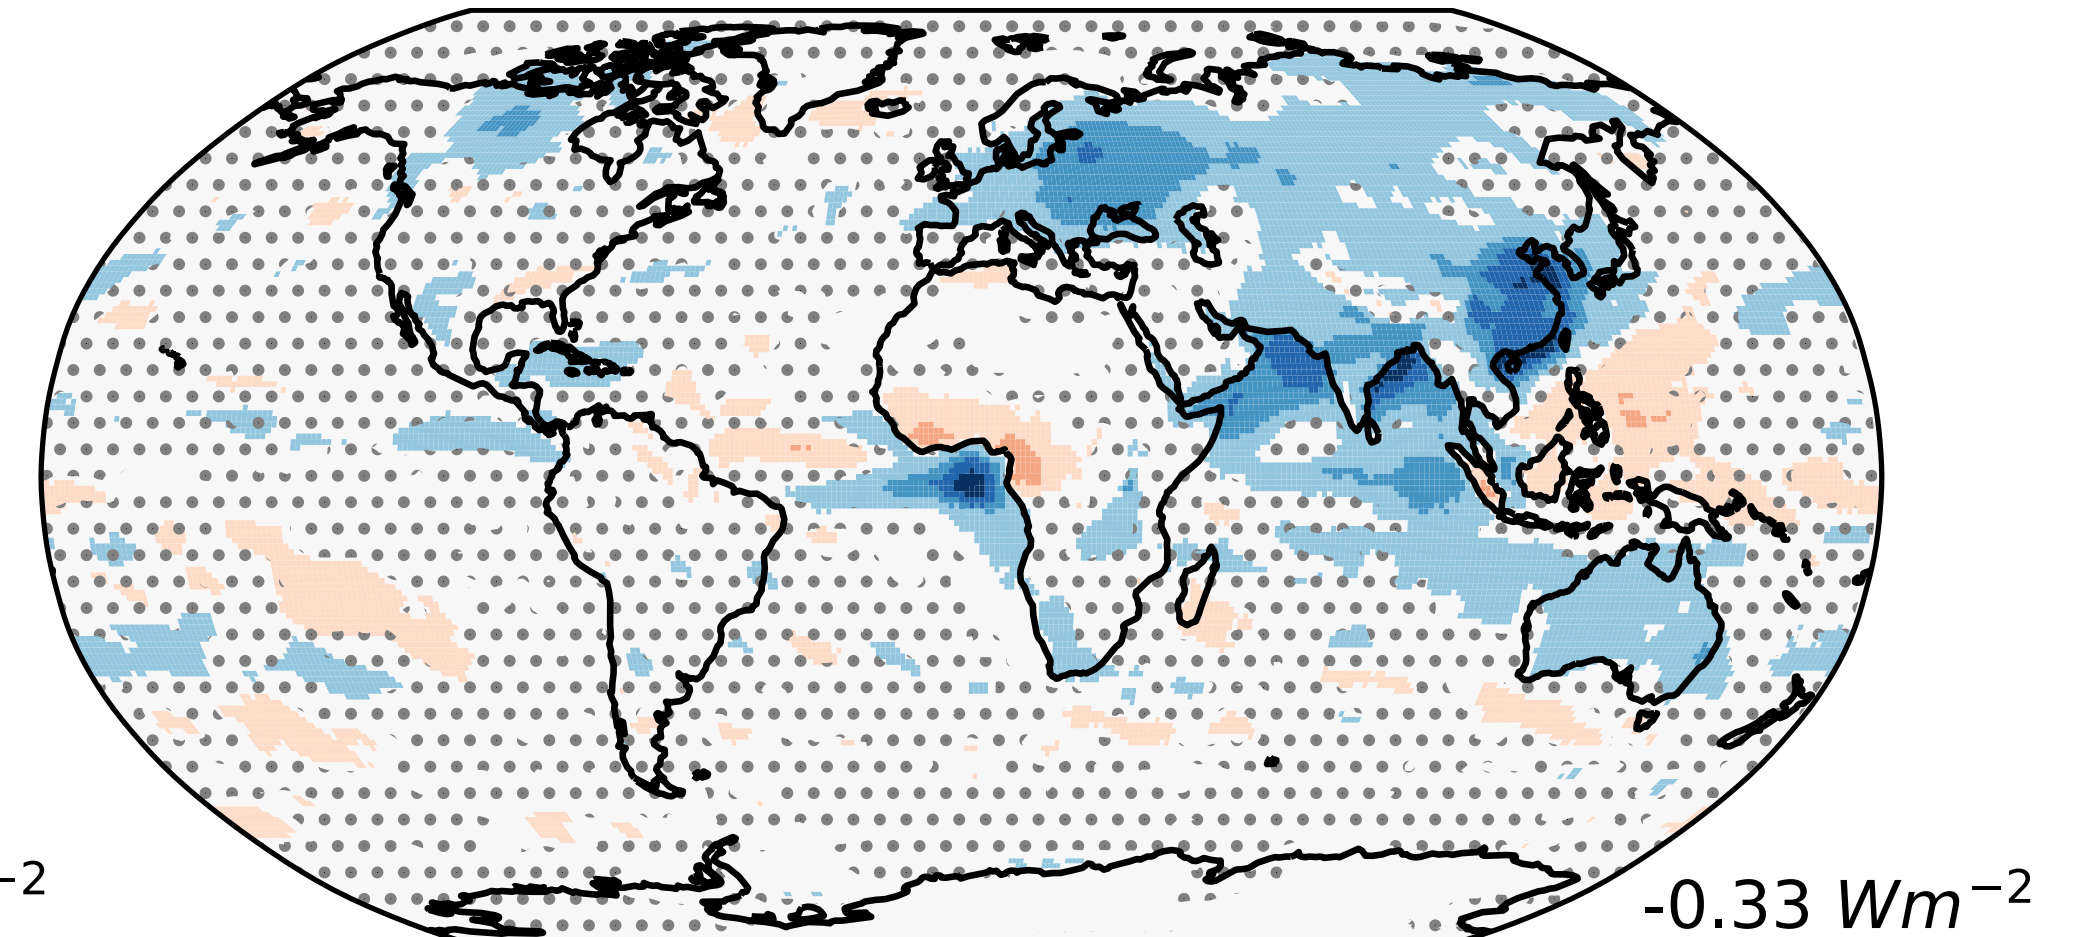

# What changes do we expect compared to CMIP6? (Based on preliminary CMIP6plus emission data)

Effective radiative forcing from SP data in ICON

CMIP6 data

Candidate for CMIP6plus

## What is next?

1. CMIP6plus / CMIP7 data for SP
2. New dust plumes parameterisation

**Thank you.**
